October 4, 2010

Lieutenant General Robert Van Antwerp
U.S. Army Chief of Engineers and Commanding General
U.S. Army Corps of Engineers
441 G Street NW
Washington, DC 20314-1000

Dear Lieutenant General Van Antwerp:

I write regarding the U.S. Army Corps of Engineers' (COE) Final Decision on the Matter of Variance from Vegetation Standards for Levees and Floodwalls, which I understand is expected by the end of October 2010.

This letter is to let you know that I support immediate efforts by the COE and affected parties in Washington State to create and implement a standard for vegetation management that fits the unique conditions in our watersheds and ensures the safety of our levee systems. Towards that end, I strongly advocate for the "regional framework" approach outlined in the enclosed August 5, 2010, letter addressed to you by the three federal executives from the Pacific Northwest region. I have also included a letter from our Congressional Delegation that endorses this type of approach as well.

I believe it is important for the COE and Washington State stakeholders to collaboratively move forward toward addressing the technical and policy issues essential to developing a meaningful and lasting solution. In my view, the regional framework approach would provide this strong foundation and will enable us to create and implement a management approach for levee vegetation that effectively provides for the public safety and protection of property, while helping us preserve and restore endangered fish species.

Thank you for your consideration of this request.

Sincerely,

A handwritten signature in blue ink that reads "Chris Gregoire".

Christine O. Gregoire
Governor

National Oceanic and Atmospheric Administration, Administrator, Dr. Jane Lubchenco, 1401 Constitution Avenue, NW, Room 5128, Washington, DC 20230

1. The federal executives in the Northwestern United States have enjoyed a long-standing record of collaboration and problem solving through a range of significant environmental challenges over the last several decades, and we remain fully committed to this collaborative problem solving. With this in mind, we write this letter to share our regional perspective on existing and proposed policy and regulations related to vegetation on levees that may be in conflict with federal law and agency guidelines, leading to understandable confusion and consternation on the part of levee owners, and likely to generate substantial objections by Members of Congress and their constituents.

2. The proposed USACE Policy Guidance Letter (PGL)—“Variance from Vegetation Standards for Levees and Floodwalls”, as published in the Federal Register for public comment (February 9, 2010), proposes to place legitimate concerns about levee integrity due to vegetation at odds with current Endangered Species Act law and well-established consultation protocols. Additionally, it is generally deficient on a number of salient points (outlined below) and specifies an effective date of September 30, 2010 which we respectfully suggest is untenable given the current state of vegetation on levees in our region and how dependent certain species of fish are on the shade and water-cooling and other life-cycle habitat features such vegetation provides.

3. We observe the following deficiencies in the proposed PGL.

a. There is an inconsistency in the definition of a “levee system” (Paragraph 5) and the requirement for individual sponsors to initiate an application for a variance. In most cases, a levee system will incorporate multiple individual sponsors with varying jurisdictions covering only a portion of the levee system. This renders the variance procedure awkward and more difficult than necessary for the sponsors.

b. The proposed PGL appropriately ascribes a variance request for the purposes to: “preserve, protect and enhance natural resources and/or protect the rights of Native Americans...” However, it does not give due consideration to instances where sound science

and ongoing research indicates that specific vegetation types may provide benefits (e.g., erosion control) or not have consequential negative impacts (e.g., small, shallow root systems) to levee integrity and public safety. Furthermore, without consideration of science and ongoing research, the proposed PGL misses the opportunity to leverage new knowledge to facilitate win-win solutions that accommodate both levee integrity concerns and endangered species habitat. Finally, a “do no harm” approach may be warranted in many instances wherein individual sponsors may not have the means to “deal with the root system after cutting down the tree”, a dangerous and likely outcome of the current policy that emphasizes tree removal as one way to maintain compliance with Corps’ vegetation standards for levees.

c. The process outlined in the proposed PGL seems overly cumbersome, leading all the way to Washington DC for final approval by the Corps’ Levee Safety Officer who has no responsibility for operating the levee system in conjunction with local authorities. We believe this approach misses a huge opportunity to leverage the very successful and productive regional decision-making model operating in the Northwest for several decades. Thus we believe the PGL should be revised to accommodate these collaborative approaches that will achieve the applicable public safety and environmental objectives of the program.

d. We would encourage a close interdepartmental coordination effort at the Washington DC level where opportunities to align the various agency policies and processes with the law are the greatest. Clearly, the concurrent goals of public safety (levee integrity) and ESA compliance are achievable but only when the various agencies coordinate such policy/law conflicts in advance of public release and implementation.

4. We propose for your immediate consideration and decision on the following:

a. Give us until December 2011 to:

(1) Develop a regional framework based on common ground around which to devise implementable local solutions.

(2) Apply the regional framework in close coordination and collaboration with local individual sponsors who ultimately must implement and resource these solutions.

(3) Allow the emerging science and ongoing research (initial Corps report due out in September 2010) to inform possible revision of the proposed PGL.

(4) Work with local constituencies and Members of Congress in a strategic communications campaign to inform the public and levee sponsors on the way ahead outlined in the regional framework.

(5) Provide individual sponsors with existing variances (including the Seattle District Regional Variance) and new applicants with the time to apply through a revised variance application process to gain approval for their plans to move forward toward achieving the Corps

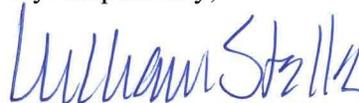

vegetation standard while the individual sponsors marshal public support and revenue to get into compliance. This may necessarily involve small steps (e.g. removal of some tree branches and/or selected vegetation for inspection visibility and/or flood fighting purposes while doing no harm).

b. Initiate coordination of proposed PGL for variance policy and/or vegetation standard among the agency headquarters to reconcile the conflict between existing law and policy. This could lead to some accommodation, including recognition of the value of science and ongoing research to inform such policy as it evolves, and allow more time for coordination and implementation to ensure our proposed regional framework is incorporated.

c. Reconcile the disconnect in the variance application process between the definition of levee system and the individual sponsors who invariably have ownership of only a portion of the system.

5. We respectfully recognize that these points may not be all inclusive, and we welcome the opportunity to review these recommendations in the context of other comments that may have been received through the review process. We believe wholeheartedly that we possess the ability to deliver on what we propose above with the allocation of time and continued vertical collaboration and alignment. We look forward to further discussion with you as we continue to tackle these urgent and compelling challenges together. Thank you for your continued support and consideration on this matter.

Very Respectfully,

AUG 05 2010

Brigadier General, US Army
Division Commander

Enclosure

Enclosure: Summary from 1 July 2010 meeting included as background information.

The Regional Administrators of the National Marine Fisheries Service (NOAA Fisheries) and the U.S. Fish and Wildlife Service (USFWS), Mr. William Stelle and Ms. Robyn Thorson respectively, met with Brigadier General John R. McMahon, Commander, Northwestern Division, USACE, on July 1, 2010 to discuss interagency cooperation to address regional concerns expressed by communities who rely on levees for flood risk reduction in Washington, Oregon, Idaho, Western Montana, and Wyoming. BG McMahon requested the meeting to begin dialogue with Mr. Stelle, Ms. Thorson, and their staffs on challenges raised by the Corps' renewed emphasis on levee vegetation maintenance and potential conflicts the Corps' policy poses to critical habitat for fish under the Endangered Species Act.

The meeting's purpose was to share the Corps' ongoing levee vegetation related activities and to achieve a common understanding of the issues related to levees including: public safety, levee vegetation maintenance, and the Corps' Rehabilitation and Inspection Program as it relates to levee certification under the Federal Emergency Management Administration's National Flood Insurance Program. The meeting's goal was to begin collaborative efforts to identify a path forward that balances each agency's congressional mandate or mission while allowing for levee vegetation maintenance.

Accordingly, the agencies agreed to work together to develop a regional framework via a roundtable process. The process as proposed follows, allowing for changes in course if and when appropriate:

- Assemble a small technical team comprised of subject matter experts representing the three agencies with the task of developing a "draft" regional framework that meets the agencies' policies and mandates. This step will include review and endorsement from the three agencies.
- Provide the "draft" framework to tribal government and state and local agencies for review and comment. The purpose of this step is to obtain their input to ensure a workable plan for state, local, and tribal resource agencies.
- Obtain the input of non-federal levee sponsors who are responsible for levee operation and maintenance and other related activities such as obtaining permits as required and requests for vegetation variances when and where appropriate. This is proposed to occur in several facilitated workshops, possibly by river basin. The intent of this effort would be to review the "draft" framework with them, and make final refinements based on local input.
- Final framework will be made available to all stakeholders and interested parties. It will be considered the roadmap for subsequent levee operation and maintenance activities in the Northwestern Region.

This proposed round table process and framework development will take time. The three agencies propose approximately 15 months to develop and implement the finalized framework. Further, it is also recognized that once the framework is in place, a transition period will be needed for levee sponsors responsible for levee maintenance on tributaries with ESA-listed fish to either submit a request for a vegetation variance or to meet the national levee vegetation standard. Consequently, after the framework is adopted, a two-year transition period (until September 30, 2013) is envisioned.

The vegetation variance policy is particularly important in the Northwest as it provides an important opportunity to allow vegetation on or adjacent to the riverward levee slope in areas where riparian habitat is critical for ESA-listed fish survival. The two-year transition period is requested to allow non-Federal sponsors to fully comply, or to develop their plan for financing and performing system-wide improvements, as allowed under the Memorandum: Temporary Extension of PL 84-99 Eligibility, dated January 9, 2009.

Congress of the United States
Washington, DC 20515

June 7, 2010

The Honorable Jo-Ellen Darcy
Assistant Secretary for Civil Works, Army
U.S. Army Corps of Engineers

Dear Ms. Darcy:

We write to request that the Army Corps of Engineers (Corps) expeditiously convene a roundtable meeting with our constituents regarding the policies and regulations concerning levee standards and certifications, and the conflicts those policies may encounter regarding other federal mandates and policies.

We appreciate your attendance at the Green River Valley stakeholders meeting on May 6th, as well as your commitment to convene a roundtable to discuss these important issues. As you heard from our constituents, existing and proposed policies and regulations have resulted in conflict between federal law and agency guidelines, which has caused a great deal of confusion for levee operators across Washington State.

You may be aware that at least three modern levees in the Green River Valley are currently not certified or are in danger of losing certification because of a lack of coordination between the Federal agencies involved in constructing and accrediting these levees. As an example, the Riverbend levee on the Green River was completed in 2008 to Corps standards, with vegetation, and has yet to be accredited by the Federal Emergency Management Agency (FEMA) because of confusion over an impending Corps policy change that will disallow vegetation on levees and end a variance the Seattle District has used to allow levee vegetation. Unfortunately, we are seeing similar situations occurring throughout Washington State.

FEMA, who must accredit a certified levee before it will modify its flood maps, has based its certification standards on Corps levee construction standards, which will soon include the proposed change to vegetation standards. These changing standards may result in levees being decertified and subsequently being shown as not providing any mitigation on FEMA's flood maps, resulting in increased insurance premiums for an entire community.

Additionally, as you know, several populations of salmon in Washington State are listed species under the Endangered Species Act (ESA). As a result of this listing, levee operators in the impacted Washington river basins must comply with the ESA, which in most cases means vegetation that provides shade to cool the water temperature must be planted on a levee. Levees required to be in compliance with the ESA could simultaneously be in conflict with proposed Corps vegetation standards if no variance is kept in place. This could also result in levees being decertified or not being accredited if the FEMA standards are not met.

It is critical that a roundtable occur without delay to address the conflicting standards and regulations in order to ensure that the levee operators can perform appropriate levee maintenance. Municipalities in several river basins across Washington State, including the Green River Valley, are caught in the middle of conflicting guidance from the many Federal agencies that have policies regarding levee regulation. This confusion may leave communities exposed to legal action or unnecessarily vulnerable to flooding. Without collaboration between all stakeholders involved, including all relevant Federal agencies, communities in Washington State will continue to face difficulties getting levees certified and accredited.

When the Corps committed to convening this roundtable during the May 6th meeting, Corps staff recommended that an initial meeting take place no later than July. We understand that in the past, similar roundtable processes have taken up to 18 months to find a comprehensive solution to conflicting levee policies.

In light of the communities in our state needing to certify their levees to ensure accurate FEMA mapping, currently being told they need to remove vegetation now to retain the certification of their levees, and the impending September date of effectiveness for the new Corps vegetation policy, we respectfully request that you initiate a roundtable process as soon as possible.

We look forward to hearing back from you on your proposed timeline to begin the roundtable process, and to working with you in the future to ensure the health and safety of our local levee systems.

Sincerely,

Neil Zeman
