Rialto Channel HEC-RAS Stationing Diagram

Flood Limits and Discharge Flowcharts (each scenario)

Table of existing and proposed streets crossing culverts

Table of existing street capacity

Table of Discharges on major road crossing for each scenario

Table of floodplain Assesses Values.

Tables of results in each scenario

STUDY AREA:

The study area is along Rialto channel between the I-10 Freeway and Cactus Basin at Baseline Avenue. The study length is approximately 3.85 miles and is located in the City of Rialto.

PURPOSE OF STUDY:

The system has been analyzed and the flood plain modeled using a combination of several different proposed projects. HEC-RAS software was used for the modeling. Each scenario has been analyzed using the anticipated 100 year runoff. Hydrology for these different conditions has been previously determined and is not included in this report.

The purpose of this study is to prioritize the phased Rialto Channel projects based on the greatest reduction in flood risk as characterized in the flood plain mapping for each scenario.

ANALYSIS APPROACH

- Due to potential obstructions within the roadways, the system was analyzed based upon a subcritical flow condition.
- The capacity of the existing Rialto Channel has been calculated to be as little as 178 cfs in some areas.
- Runoff that overtops Rialto channel and flows onto local streets was analyzed using side weirs at each street crossing thus resulting in a spilt flow through the adjoining streets.
- A separate HEC- RAS study for each intersecting major streets was prepared using the Q resulting from the side weir analysis.
- The anticipated runoff resulting from the spilt flow analysis was compared to the calculated street capacity. flooding was assumed to occur wherever the calculated Q100 runoff was greater than the calculated street capacity..

DESCRIPTION OF POTENTIAL IMPROVEMENT SCENARIOS

1. **Existing condition with no additional improvements (no attenuation within Cactus Basins)**

   The system was analyzed and the flood plain modeled based on the existing condition of Basin #3,4 and 5, channel geometry and crossing culverts. Due to the current metering of the outlet structure beneath Baseline Avenue, flow is assumed to flow from Basin 3 unto the intersection of Baseline and Cactus Avenues. Q100 at this location is 8.646 cfs.

   This condition assumes ultimate condition drainage flow baths downstream of the basin

2. **Construction of ultimate improvements to Cactus Basin No. 3.**

   The system was analyzed and the flood plain modeled based on the ultimate improvements of basin #3 only without any improvements of the channel or crossing culverts. Again, due to the current metering of the outlet structure beneath Baseline Avenue, flow is assumed to flow from Basin 3 unto the intersection of Baseline and Cactus Avenues. Q100 at this location is 5,104 cfs.

3. **Construction of ultimate improvements to Cactus Basin No. 3,4 and 5.**

   The system was analyzed and the flood plain modeled based on the ultimate improvements of basin #3,4 and 5 without any improvements of the channel or crossing culverts. Again, due to the current metering of the outlet structure beneath Etiwanda Avenue, flow is assumed to flow from Basin 1 unto the intersection of Etiwanda and Cactus Avenues. Q100 at this location is 1,329 cfs.

4. **Construction of ultimate Cactus Basin No.3 with construction of ultimate road crossings at Foothill Blvd, Merrill Ave, Randall Ave, and Cactus Avenue.**

The system was analyzed and the flood plain modeled based on the ultimate improvements of basin #3 only with improvements of the above crossing culverts. Again, due to the current metering of the outlet structure beneath Baseline Avenue, flow is assumed to flow from Basin 3 unto the intersection of Baseline and Cactus Avenues. Q100 at this location is 5,104 cfs.

5. **Construction of ultimate Cactus Basin No.3, construction of all ultimate road crossings with interim earth channel Improvements to convey Q of 1000 cfs.**

   The system was analyzed and the flood plain modeled based on the ultimate improvements of basin #3 only with ultimate improvements of downstream road crossing culverts. Again, due to the current metering of the outlet structure beneath Baseline Avenue, flow is assumed to flow from Basin 3 unto the intersection of Baseline and Cactus Avenues. Q100 at this location is 5,582 cfs.

   In order to model interim earth channel Improvements to convey a design Q of 1000 cfs, Rialto channel cross section has been modeled as ineffective flow and subtract 1000 cfs from the discharge of the channel.

6. **Construction of ultimate Cactus Basin No.3 and ultimate Rialto Channel from Etiwanda Avenue to I-10 including all road crossings.**

   The system was analyzed and the flood plain modeled based on the ultimate improvements of basin #3 only with ultimate improvements of road crossing culverts. Q100 outlet flow from basin #1 is 5,582 cfs.

   To model ultimate channel Improvements, Rialto channel cross sections have been modeled as ineffective flow and subtract Q design from the total discharge of the channel.

7. **Construction of ultimate Cactus Basin No.3, construction of all ultimate road crossings with interim earth channel Improvements to convey Q of 1260 cfs.**

The system was analyzed and the flood plain modeled based on the ultimate improvements of basin #3 only with ultimate improvements of downstream road crossing culverts. Again, due to the current metering of the outlet structure beneath Baseline Avenue, flow is assumed to flow from Basin 3 unto the intersection of Baseline and Cactus Avenues. Q100 at this location is 5,582 cfs.

In order to model interim earth channel Improvements to convey a design Q of 1260 cfs, Rialto channel cross section has been modeled as ineffective flow and subtract 1260 cfs from the discharge of the channel.

8. **Pre-Freeway construction condition with no additional improvements (no attenuation within Cactus Basins)**

The system was analyzed and the flood plain modeled based on pre-freeway construction condition and the existing condition of Basin #3,4 and 5, channel geometry and crossing culverts. The pre-freeway Q100 condition was determined to be 2760 cfs from a separate report. This condition also assumes ultimate condition drainage flow baths downstream of the basin. Due to the current metering of the outlet structure beneath Baseline Avenue, flow is assumed to flow from Basin 3 unto the intersection of Baseline and Cactus Avenues.

Within the exhibit for this condition the Q100 existing condition as discussed in Scenario 1 is also shown for comparison purpose.
