

Attachment 9. Past Performance

The District was the recipient of a \$462,500 CalFed Conjunctive Use Grant in September 2000. This grant was for a five-year pilot project involving wet-year water from the Mokelumne River. Physical facilities constructed with the grant funding include a fish screen, a 10 cfs pumping station, 2,000 feet of 20-inch pipeline and a 10 acre recharge basin. The intent of the project is to recharge up to 1,000 AFY when water is available. The project was completed on time and budget, and the facilities are used whenever water is available from the Mokelumne River. This grant was administered by the Department of Interior.

Currently, the District has a grant from the U.S. Bureau of Reclamation for \$300,000 for the Tracy Lake Project in which water is diverted during wet years from the Mokelumne River. This project is also being funded \$636,000 by the formation of the Improvement District No. 1, which has issued warrants and collected a water charge from land owners. The project involves constructing a 25 cfs pump station for diverting water into Tracy Lake. Tracy Lake will serve both as a storage reservoir and a recharge facility. The ultimate goal will be for Tracy Lake project to divert up to 4,000 acre-feet annually during wet years for groundwater recharge. This project is currently on schedule and is in the preliminary planning and environmental documentation phase.
