A P P E A R A N C E S

MODERATOR:

Rick Davis, The Davis Group

SPEAKER PANEL:

Rob Thomson, Entrix

Lanika Cervantes, U.S. Army Corps of Engineers

Arturo Delgado, California Department of Fish and Game

1 MR. DAVIS: With that, we will open it to comment
2 or questions. Arturo, Lanika, and Rob will answer
3 questions and fire away. Comments, questions? Okay? I'm
4 sure there's questions.

5 MR. SANCHEZ: Couple questions. For the initial
6 water to fill the ponds, is that water also coming down
7 from the rivers?

8 MR. DELGADO: Right now the water sources that
9 we're considering would be the Alamo, the New River and
10 the Whitewater River. So that would be the primary source
11 of water that we would use for the ponds.

12 MR. DAVIS: I forgot to say this at the
13 beginning. If you tell us your name and whatever.

14 MR. SANCHEZ: Emmanuel Sanchez with Imperial
15 County Air Pollution Control District. If that water was
16 intended for the Salton Sea prior to filling the ponds,
17 how is that going to affect the water levels at the Salton
18 Sea?

19 MR. DELGADO: I'm going to -- I think Rob would
20 probably do a better job at handling that question.

21 MR. THOMSON: We haven't done all of the
22 calculations to completely document exactly what's going
23 on. However, the slope of the land that we would be
24 inundating with the ponds is approximately the same slope
25 as that in the sea, so the 240 acres or whatever the

1 acreage turns out to be is approximately the same amount
2 of surface area that that water would have covered in the
3 sea.

4 Also, the -- you know, I don't know exactly the
5 percentage. I would have to do some quick math to try to
6 figure out how much of the water would be -- in the ponds
7 would be as a percentage of the sea. It's a pretty small
8 number though.

9 MR. DELGADO: We did that calculation once and it
10 was like half of one percent, but ultimately that analysis
11 we're going to be addressing in the environmental
12 document. So if there's an effect from it, then we'll
13 have to consider that, and if it's a significant impact,
14 we would have to review that impact.

15 MS. SOUCIR: Monica Soucir, S-o-u-c-i-r. Just
16 going back to that analysis real quick, you said it's
17 going to be part of the EIR. Is it currently part of the
18 AIS?

19 MR. DELGADO: The document is a joint document,
20 so it would be part of that joint document.

21 MS. SOUCIR: So you mentioned the New River,
22 Alamo. What was the other one?

23 MR. DELGADO: The whitewater.

24 MS. SOUCIR: The whitewater. Your preliminary
25 analysis indicates that it's less than one percent

1 reduction in --

2 MR. DELGADO: If I remember correctly.

3 MS. SOUCIR: -- shoreline exposure?

4 MR. DELGADO: It's actually total water we would
5 need for the project compared to the total volume coming
6 in. The volume of water.

7 MS. SOUCIR: We're talking volume, not what
8 affect it's going to have as far as the shoreline, not
9 surface area.

10 MR. DELGADO: But that's something we will need
11 to look at.

12 MR. WILCOX: Bruce Wilcox with Imperial
13 Irrigation District. One other thing to add to that
14 concern is there is going to be a breakdown on who is
15 responsible for what mitigation under QSA and under other
16 things, and I would suggest we should look at how much
17 additional sea -- or how much additional plight exposure
18 will be exposed sooner based on the water use out of those
19 ponds. IID is delivering mitigation water to the sea
20 until 2017 for mitigation for that, and we just need to
21 make sure that we calculate what that is and how we're
22 going to deal with the difference.

23 MR. DAVIS: Thank you. That's a good comment.

24 Other comments? No more questions? Yes, Ted.

25 MR. FRANK: Ted Frank. Arturo, can you clarify

1 the layout, where the intent of the layout of the ponds is
2 and how the water currently --

3 MR. DELGADO: Rob could do a better job with
4 that.

5 MR. THOMSON: All preliminary, as you know. This
6 is all part of the alternatives development which we're in
7 the middle of, not anywhere complete and ready for
8 publication, but the water would be diverted from the
9 rivers and conveyed in some fashion. The fashion is
10 either open canal or in a pipeline to the ponds, and then
11 depending upon exactly what treatment and operational
12 scheme one wishes to test and validate, you'll have the
13 de-salt balance, look at selenium concentrations, look at
14 primary productive and look at how much algae you're
15 growing and how the rest of the food chain is doing, and
16 eventually discharge that water probably on for balancing
17 salt so that the salinity in the ponds stays relatively
18 constant back into the sea. The ponds would go laterally
19 across the current shoreline, stair-step down the sea.

20 MR. WILCOX: Can you show that?

21 MR. THOMSON: I was thinking about it, but the
22 map won't help you much because it's the wrong scale.
23 These are only six foot deep ponds and they're not going
24 way out into the sea, they're going along the shore and
25 along the shore could be -- I'm thinking Alamo north and

1 south, couple miles long, and then have a terminal barrier
2 that's about six feet tall with probably a road on top and
3 so on, and ponds would potentially increase in salinity as
4 you moved away from the river. If you can imagine where
5 one pond would flow into the next potentially, but the
6 exact character and location and how they all fit together
7 and stuff hasn't been developed. It's not done yet. It's
8 just barely started.

9 MR. DELGADO: So in summary it would run -- we
10 envision it running along the contour line minus 228,
11 moving away from one of the rivers, where we end up siting
12 the project. So it could be one or more rivers.

13 The alternative will be analyzed. Correct.

14 MR. WILCOX: At the other meetings, and just
15 verify this is still on the table, of how you look at the
16 alternatives is to locate as much as to the extent
17 practical, so this -- so that it will help with air
18 quality or be a barrier. In the long run this is going to
19 be one of the -- nothing is going to be easy, one of the
20 best ways to control some of the emissions off of there.

21 MR. THOMSON: Absolutely. The air quality is --
22 air quality management and reducing emissions from the
23 newly exposed soils is clearly a benefit of this project
24 and would be clearly considered in the development of the
25 design and the environmental effects. The project's not

1 designed to mitigate air quality impacts. The project and
2 the goals and objectives of the project are about fish and
3 fish-eating birds, not air quality, but as a side benefit
4 clearly it's going to cover up 2,000, 3,000 acres of
5 recently exposed soil.

6 MR. DAVIS: Yes, sir.

7 MR. JOHNSON: Paul Johnson, Imperial County. Is
8 the water flowing in right now in those rivers suitable or
9 conducive to what you're trying to do, species you're
10 trying to encourage?

11 MR. DELGADO: With the water quality of the three
12 rivers, that's the water that we have to work with, so we
13 just have to do our best job in trying to make it work.

14 MR. JOHNSON: Do you consider or do you think you
15 might -- you'll need to pretreat the water before it gets
16 in there?

17 MR. DELGADO: That's something that we're
18 considering as an option, yes.

19 MR. JOHNSON: Assuming it's not the way it's
20 supposed to be, the water is not proper for what you're
21 trying to accomplish, do you anticipate the ponds becoming
22 more saline over time?

23 MR. DELGADO: Optimize fish population so we can
24 actually support fish and birds.

25 MR. JOHNSON: Do you think that putting

1 substandard water in these ponds in soil that is very
2 salty is going to accomplish what you want to do without
3 treatment?

4 MR. THOMSON: The treatment is not likely needed
5 for salinity. That can be either flushed out or this
6 isn't a necessarily -- not at all envisioned as a batched
7 process, if you will, that you fill up the bathtub and let
8 it stew for a while. It is likely to have a very low flow
9 but a flow content through it in order to maintain
10 salinity in successive ponds.

11 MS. SOUCIR: I have a question. Now that he's
12 talking about salinity, is your analysis going -- I know
13 that this is all preliminary, but are you going to be
14 looking at the salinity content as it exists right now and
15 its origins and then try and -- because you said you were
16 going to do treatment for salinity or try and control
17 salinity, so I'm assuming that you feel that it's coming
18 from a different source other than it's there already. So
19 are you going to analyze both?

20 MR. THOMSON: Let's try a little bit of
21 hydrology and water chemistry. The influent water in the
22 streams right now, the river salinity ranges from about
23 something under 2,000 milligrams per liter to 5,000
24 milligrams per liter depending on exactly where you sample
25 and the time of year and so forth on and so forth. The

1 ponds could be, as I showed in the graph, close to sea
2 water, and so salinity will be managed and balanced by
3 balancing inflow and outflow.

4 The water treatment is likely to be for sediment
5 first, to remove sediment before it gets into the ponds so
6 the ponds don't fill up, or you could use the first pond
7 as your sediment capture basin if you wanted to, going
8 down the list of water quality criteria that at least of
9 concern to me and others is probably selenium, another
10 salt that is in the water that's dissolved in the water
11 that is mostly coming from upstream, way upstream in the
12 Rockies, potentially some sources in the valleys as well,
13 but principally from upstream, and the salinity by the way
14 is also from well upstream by Grand Junction, Colorado.

15 Then there's nutrients that are going to grow
16 algae and other -- provide a basis for the aquatic
17 ecosystem. There would be other contaminants that might
18 be a concern, but those are probably my first three
19 that -- and others that we would be concerned about
20 monitoring.

21 Remember, the second goal is to learn from this
22 and be able to then develop a scheme so that should the
23 legislature decide to build a lot of this, we have some
24 in-place knowledge as to how to manage this problem, these
25 kinds of facilities.

1 MS. SOUCIR: The reason I ask why -- it's Monica
2 again. Because doesn't the water -- the Regional water
3 Quality Control Board currently have a program with the
4 current farmers here in Imperial County where they are
5 controlling the sediment that goes into the drain ditches?

6 MR. THOMSON: Bruce, you're more adept at this
7 man I am.

8 MR. WILCOX: The TMDL program at this point is
9 voluntary, but yes, there is a program. I'm not sure I
10 understand this -- whatever -- if I understand it
11 correctly, whatever goes into the ponds is going to
12 discharge onto the Salton Sea, it's going to be river
13 water anyway. I don't see an increased amount of TMDL for
14 sediment. There aren't any -- to my knowledge any limits
15 right now anyway.

16 MR. THOMSON: Discussions about nitrates. There
17 were at one time concerns about pathogens, but those have
18 been more or less --

19 MR. WILCOX: Nutrients I think is the next one.
20 I'm not sure I'm addressing what you're asking.

21 MS. SOUCIR: Wondering if that's what the
22 analysis was going to take into effect and account.

23 MR. THOMSON: Certainly take it into account.

24 MR. JOHNSON: Paul Johnson again. Do you think
25 the treatment for sediment, do you anticipate that being

1 kind of a holding pond where it's settled out and mined
2 out or scooped out?

3 MR. THOMSON: That's a simple way to do it. Let
4 me make sure -- if you're familiar with the program EIR,
5 the sediment management issue with the whole sea solution
6 is a much more complex and much more difficult problem
7 than the sediment issue for these ponds because the
8 sediment, big sediment loads occur during rainy season and
9 during high runoff events. This project can bypass all
10 that water and not take that water where if you're trying
11 to capture as much as possible of this water and turn it
12 into ponds, then you have to remove it and you have to
13 capture all or a large portion of that runoff water when
14 there's high sediment loading. This project can go it's
15 raining, we just don't need the input today, let the water
16 go by and close the valve.

17 MR. JOHNSON: Sounds good. I guess the point of
18 what I was trying to drive at is if you don't have pools
19 of standing water and stagnancy. From a control
20 standpoint, it would best reserved by water flowing
21 through constantly with very little stagnancy developing
22 so that keeping up vegetation and keeping the water moving
23 to some extent is probably the best thing you can do to
24 keep mosquitoes from breeding.

25 MR. THOMSON: Let's leap back to this slide. If

1 there are things that you can provide that help us
2 understand a specific flow rate that help us understand
3 what the design criteria are best to avoid effects of
4 vectors, that would be wonderful. If we can sit down and
5 talk to you specifically about some of the design criteria
6 so that we can avoid things that we didn't know, that we
7 didn't know in the development of this.

8 MR. JOHNSON: Probably it would be best if I gave
9 you written comments because I'm going to have to do some
10 research. I don't have it off the top of my head.

11 MR. THOMSON: It's not right now. We'll be back
12 to you.

13 MR. JOHNSON: All right.

14 MR. THOMSON: When are we coming back? The next
15 time we would formally be here. Are we going to be here
16 for the draft?

17 MR. DELGADO: I would think so.

18 MR. THOMSON: Once a draft Environmental Impact
19 Statement, Environmental Impact Report is there, and then
20 instead of asking you for comments on the scope of the
21 document, it would be comments on the document itself, did
22 we hear what you said during scoping and did we modify the
23 goals and objectives or alternatives or affects in a way
24 that you expected us to do. Sir, you had a question.

25 MR. HOLING: Juan Holing (phonetic) with the

1 Brawley Chamber of Commerce. And looking away from all
2 the water quality issues and so forth, the -- these are
3 supposedly at this time experimental type ponds as I
4 understand it. At some time if there's a build-out will
5 there be public access or is public access being
6 contemplated during this time period? If you're going to
7 attract birds into their habitat and other species in
8 there, it might be something that the local public can,
9 actually the tourist public might --

10 MR. DELGADO: Put my Fish and Game hat on now.
11 From Fish and Game's perspective, we envision some public
12 access to the ponds. Just fishing opportunities -- we
13 just have to kind of evaluate to determine which of those
14 activities makes the most sense.

15 MR. DAVIS: Any other, anyone else have
16 questions? Comments?

17 MR. THOMSON: If you think of any, please take
18 names and addresses and provide them.

19 MR. DAVIS: Take one of these with you.

20 MR. THOMSON: In whatever media you choose.

21 MR. DAVIS: We've got E-mail addresses on there,
22 regular mail address.

23 MR. THOMSON: And phone numbers.

24 MR. DAVIS: And phone. well, no.

25 MR. THOMSON: Doesn't have phone numbers. Good.

1 We want them written.

2 MR. DAVIS: We have another meeting this evening
3 in Brawley. I'm sure we'll get many of your Brawley
4 Chamber of Commerce members there we hope, and thank you.
5 And again, please send us your comments if you develop
6 them and again thank you for being here today.

1 REPORTER'S CERTIFICATION

2
3 I, Terri L. Emery, Certified Shorthand Reporter,
4 in and for the State of California, do hereby certify:

5
6 That the foregoing proceedings were taken before me
7 at the time and place herein set forth; that the
8 proceedings were reported stenographically by me and
9 later transcribed into typewriting under my direction;
10 that the foregoing is a true record of the proceedings
11 taken at that time.

12
13 IN WITNESS WHEREOF, I have subscribed my name this
14 16th day of July, 2010.
