## 1 Plan Preparation

---

Cal Water is an investor-owned public utility supplying water service to 1.7 million Californians through 435,000 connections. Its 24 separate water systems serve 63 communities from Chico in the North to the Palos Verdes Peninsula in Southern California. California Water Service Group, Cal Water's parent company, is also serving communities in Washington, New Mexico and Hawaii. Rates and operations for districts located in California are regulated by the California Public Utilities Commission (CPUC). Rates are set separately for each of the systems. Cal Water incorporated in 1926 and has provided water service to the Westlake community since 1983.

### 1.1 Purpose

California Water Code §10644(a) requires urban water suppliers to file with the Department of Water Resources, the California State Library, and any city or county within which the supplier provides water supplies, a copy of its Urban Water Management Plan (UWMP), no later than 30 days after adoption. All urban water suppliers as defined in Section 10617 (including wholesalers), either publicly or privately owned, providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet annually are required to prepare an UWMP.

This UWMP is a foundation document and source of information for a Water Supply Assessment and a Written Verification of Water Supply. An UWMP also serves as:

- A long-range planning document for water supply,
- Source data for development of a regional water plan, and
- A source document for cities and counties as they prepare their General Plans.
- A key component to Integrated Regional Water Management Plans.

### 1.2 Coordination

Cal Water completed a draft of the UWMP for the District on April 1, 2011. The draft was sent to the agencies listed in Table 1.2-1 for review and comment. Copies of the draft plan were available at Cal Water's corporate office in San Jose, and District office for public review and comment.

**Table 1.2-1: Coordination with Appropriate Agencies (Table 1)**

Agency	Participated in developing the plan	Commented on the draft	Attended public meetings	Was contacted for assistance	Was sent a copy of the draft plan	Was sent a notice of intention to adopt	Not involved/ No information
City of Thousand Oaks				✓	✓	✓	
City of Westlake				✓	✓	✓	
Ventura County				✓	✓	✓	
Calleguas Municipal Water District	✓			✓	✓	✓	

Cal Water conducted a formal public meeting to present information on its Westlake District UWMP on June 9, 2011, from 7:00-9:00 p.m. at the following location:

North Ranch Community Center  
1400 North Westlake Blvd.  
Westlake Village, CA 91362

Proof of the public meeting is presented in Appendix A.

### 1.3 Plan Adoption

The deadline for final comments was June 15, 2011. The final plan was adopted by the Vice President of Engineering & Water Quality on June 24, 2011 and was submitted to California Department of Water Resources within 30 days of approval. Appendix A presents a copy of the signed Resolution of Plan Adoption. In addition to the resolution, Appendix A also contains the following:

- Any comments received during the public review of this plan.
- Minutes from the public meeting.
- Correspondence between Cal Water and participating agencies.

A copy of the final version of this report will be sent to the agencies listed in Table 1.2-1 and to the California State Library.

## 1.4 Water Management Tools

Cal Water uses the following water management tools to optimize management of water resources for the District:

- ◆ Computerized Hydraulic Model for analysis of various operating conditions within the water distribution network and for planning operational and facility improvements. For smaller systems, a simple model is maintained that only models trunk lines, key sources, and major delivery points.
- ◆ Supervisory Control and Data Acquisition (SCADA) system that provides information as to how the water system is operating, provides operational control functions, and maintains a historical record of selected data.
- ◆ Revenue Management Solutions (RMS) is an information system that Cal Water uses to maintain detailed historical records including the water sales and customer service connections.
- ◆ District Report on Production (DROP) is a database that maintains water production data for wells and purchased amounts from wholesale service connections.
- ◆ Geographical Information Systems (GIS) that combines multiple sources of information and allows data to be electronically mapped for analysis and understanding of growth and constraints on land development and water use.
- ◆ Laboratory Information Management System (LIMS) provides water quality data for detailed constituent analysis of raw and finished water, determination of compliance with state and federal drinking water standards, and trends in water quality changes.
- ◆ Water Supply and Facilities Master Plan for identification of near and long term capital improvement projects for water system facilities and equipment using all of the above tools and Cal Water experience in design and construction.
- ◆ Computerized Maintenance Management System (CMMS) is a computerized database system that tracks asset data, assigns and schedules maintenance work orders, and reports on maintenance related activities. A CMMS allows a business to manage maintenance work more effectively and is a stepping stone towards Asset Management (AM).

## 1.5 Plan Organization

This plan is organized as described in the following outline. The corresponding provisions of the California Urban Water Management Planning Act are included as references. Tables in this plan have cross-references to the tables as listed in the "Guidebook to Assist Water Suppliers to Prepare a 2010 Urban Water Management Plan" prepared by the California Department of Water Resources.

Section	Table 1.5-1: Plan Organization	Act Provision
Contact Sheet	<u>List of Contact Persons</u>	-
Section 1	<u>Plan Preparation</u> This section describes the requirement and the purpose of the Urban Water Management Planning Act, coordination, plan adoption, schedule, and management tools.	§10620 (d)(2) §10621(a -b) §10635(b) §10642 §10643 §10644 (a) §10645
Section 2	<u>System Description</u> This section describes the District service area and includes area information, population estimate, and climate description.	§10631 (a)
Section 3	<u>System Demands</u> This section describes the water supply projection methodology used to estimate water demands and supply requirements to 2040. It also includes a discussion of SBx7-7 baselines and targets.	§10631 §10608.20(e)
Section 4	<u>System Supplies</u> This section includes a detailed discussion of the water supply sources.	§10631 §10633 §10634
Section 5	<u>Water Supply Reliability and Water Shortage Contingency Planning</u> This section includes a discussion of the water supply reliability and describes the District's planning for water shortages during drought and emergency situations.	§10620 §10631 (d) §10632 §10634 §10635 (a)
Section 6	<u>Demand Management Measures</u> This section describes Cal Water's conservation programs.	§10631
Section 7	<u>Climate Change</u> This section contains a discussion of climate change.	
Section 8	<u>DWR Checklist</u> This section includes the completed DWR UWMP Checklist.	
Appendix A	<u>Resolution To Adopt The Urban Water Management Plan</u> This section includes the following: 1) Resolution 2) Letters to and comments from various agencies 3) Minutes from the public hearing 4) Correspondence between Cal Water and participating agencies	§10621 (b) §10642 §10644 (a)
Appendix B	<u>Service Area Map</u> This appendix includes the service area map of the District as filed with the Public Utilities Commission.	-
Appendix C	<u>Water Supply, Demand, And Projection Worksheets</u> This section includes the spreadsheets used to estimate the water demand for the District.	-
Appendix D	<u>DWR Groundwater Bulletin 118</u> Sections from the Department of Water Resources Bulletin 118 are included as	§10631 (b)(1-4)

<u>Section</u>	<u>Table 1.5-1: Plan Organization</u>	<u>Act Provision</u>
	reference and provide details of the basin for the District.	
Appendix E	<u>Tariff Rule 14.1 Water Conservation And Rationing Plan</u> This section contains the tariff rule for reference.	-
Appendix F	<u>Water Efficient Landscape Guidelines</u> This section contains the Guideline for Water Efficient Landscape that Cal Water uses at its properties, including renovations.	-
Appendix G	<u>Conservation Master Plan</u> This section contains the District's Conservation Master Plan.	§10631 (j)
Appendix H	<u>Purchase Agreement</u> The Purchase Agreement between Calleguas Municipal Water District and Cal Water is attached as a reference.	-

## 1.6 Implementation of Previous UWMP

Cal Water will follow the California Water Code and file an UWMP at least once every five years on or before December 31, in years ending in five and zero. Since Cal Water operates 24 separate service districts the UWMP for each district has historically been submitted every third year to coincide with its California Public Utilities Commission (CPUC) general rate case (GRC) schedule. This method divided the districts into three sets that followed an established three-year schedule. The Plan for Westlake was last submitted as part of the 2006 grouping. Cal Water has since eliminated these groupings and will now file a GRC for all districts every third year and an UWMP every fifth year.

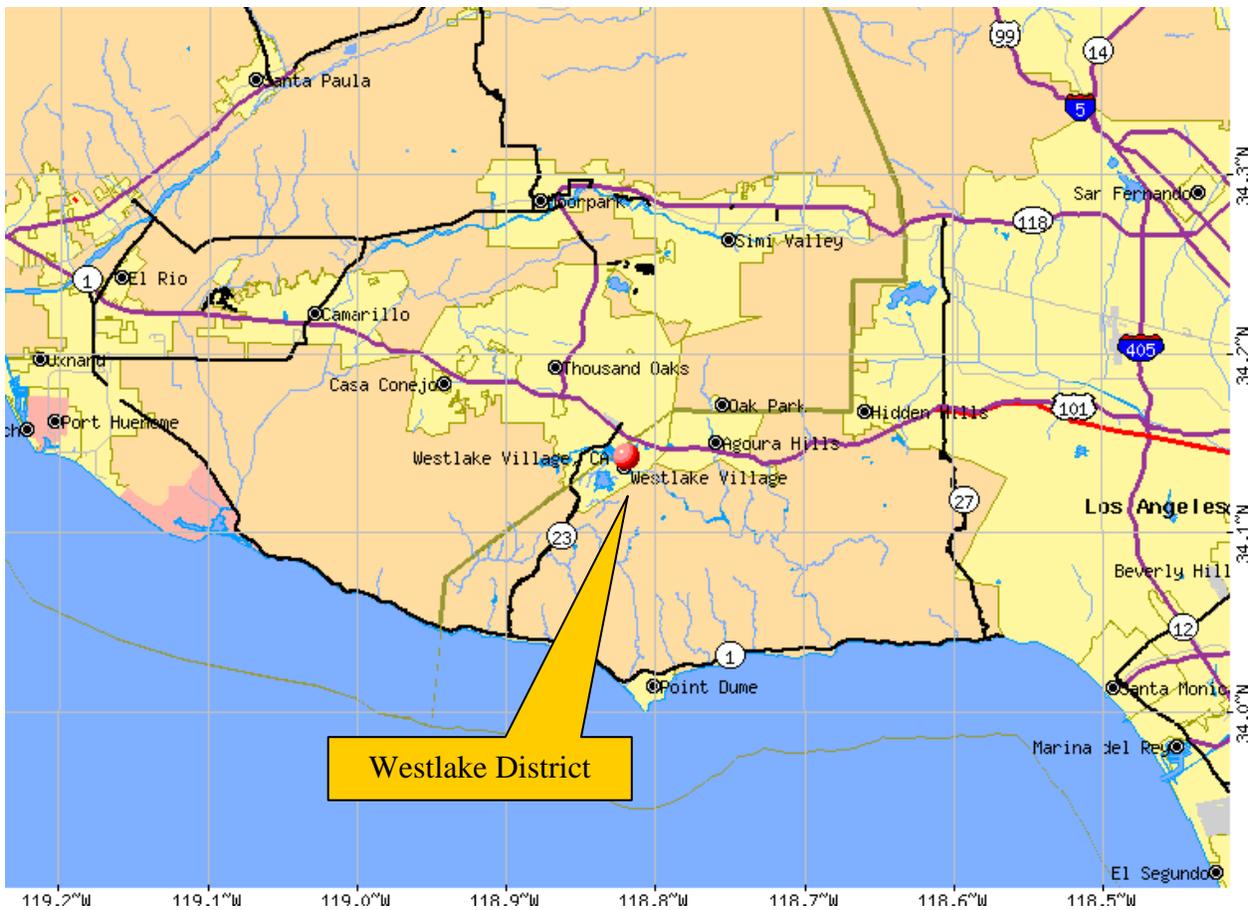

## 2 System Description

### 2.1 Service Area Description

The Westlake District is located in the eastern section of Ventura County within the City of Thousand Oaks. The service area lies approximately 40 miles northwest of Los Angeles via Highway 101. The service area encompasses 8,200 acres which was part of the historic Russell Valley Ranch. Elevation in the area varies from approximately 900 feet to approximately 1,675 feet above sea level. Figure 2.1-1 shows a general location map of the District in relation to other cities in the area<sup>1</sup>.

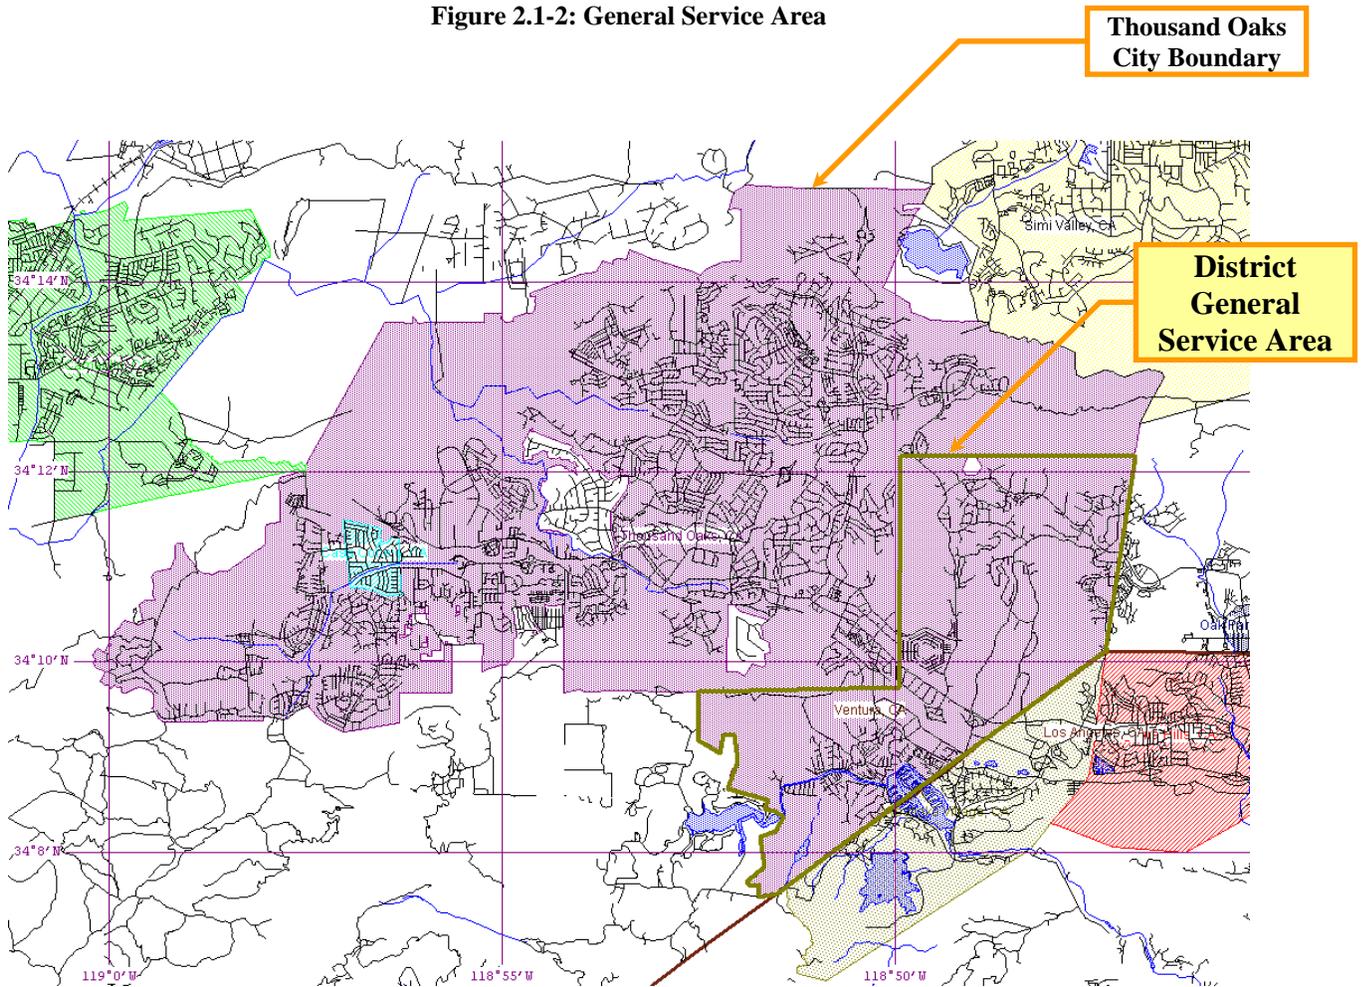

Figure 2.1-1: General Location of Westlake District

<sup>1</sup> City Data Website, Downloaded from: <http://www.city-data.com/city/Westlake-California.html>

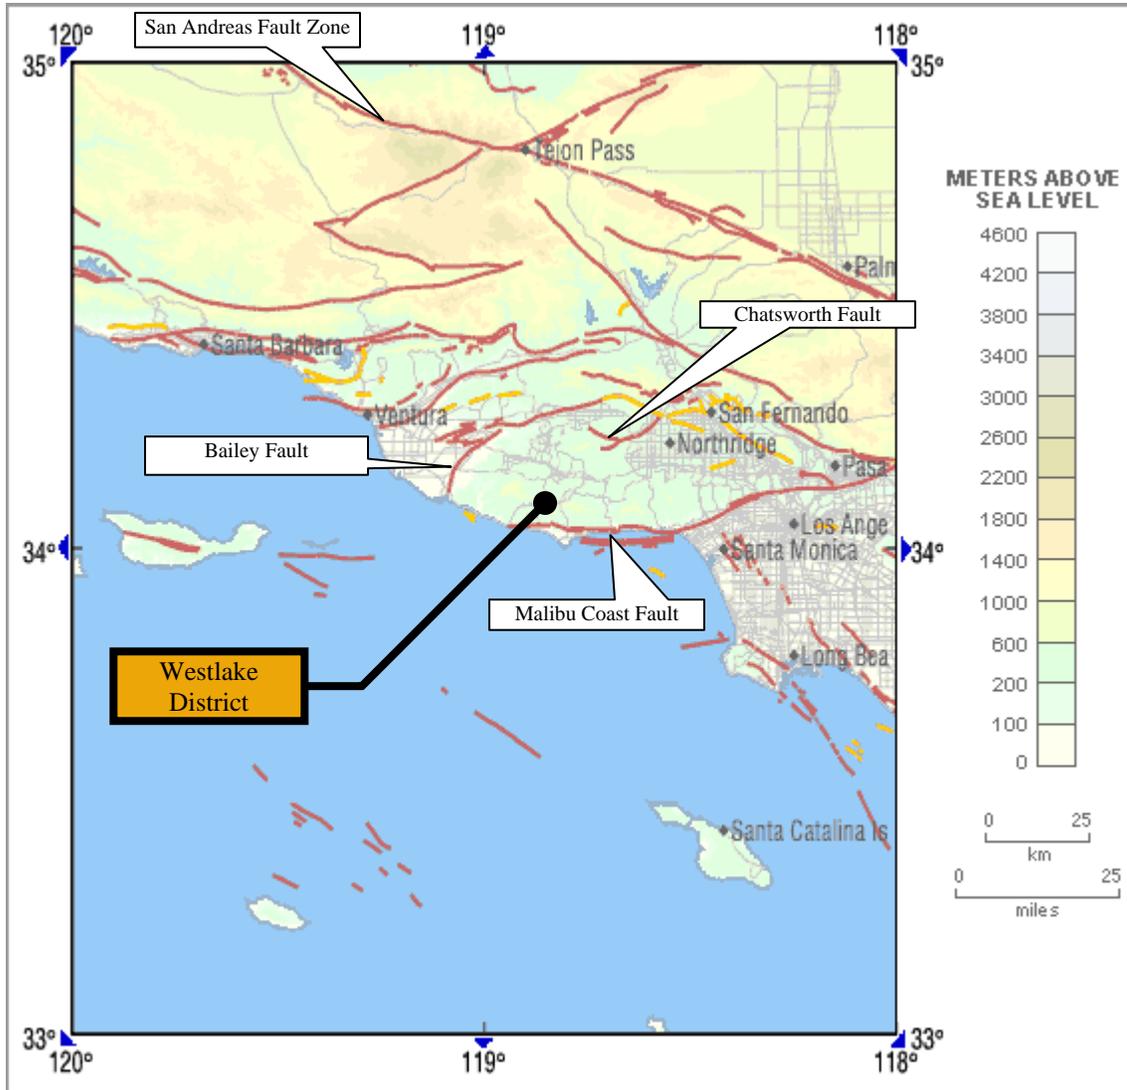

The City of Thousand Oaks Water Department and California American Water Company own and operate water systems in the remaining area of the city. Figure 2.1-2 shows the approximated service area of the District in relation to the City boundary.

Figure 2.1-2: General Service Area

The San Andreas Fault Zone is situated to the north-east. The Bailey, Malibu Coast, and Chatsworth Faults surround the District. These faults, along with many others, are responsible for the uplift of base rock that forms the Santa Monica and San Gabriel Mountains bordering the District. A major earthquake on these faults may disrupt water service. The Pacific Ocean lies to the southwest of the District. Figure 2.1-3 shows the relation of the District and the major fault lines in the area.<sup>2</sup>

Figure 2.1-3: Major Fault Lines near Westlake District

Source: USGS

<sup>2</sup> United States Geological Service, Earthquake Hazards Program, Downloaded from: <http://quake.wr.usgs.gov/info/faultmaps/119-34.html>

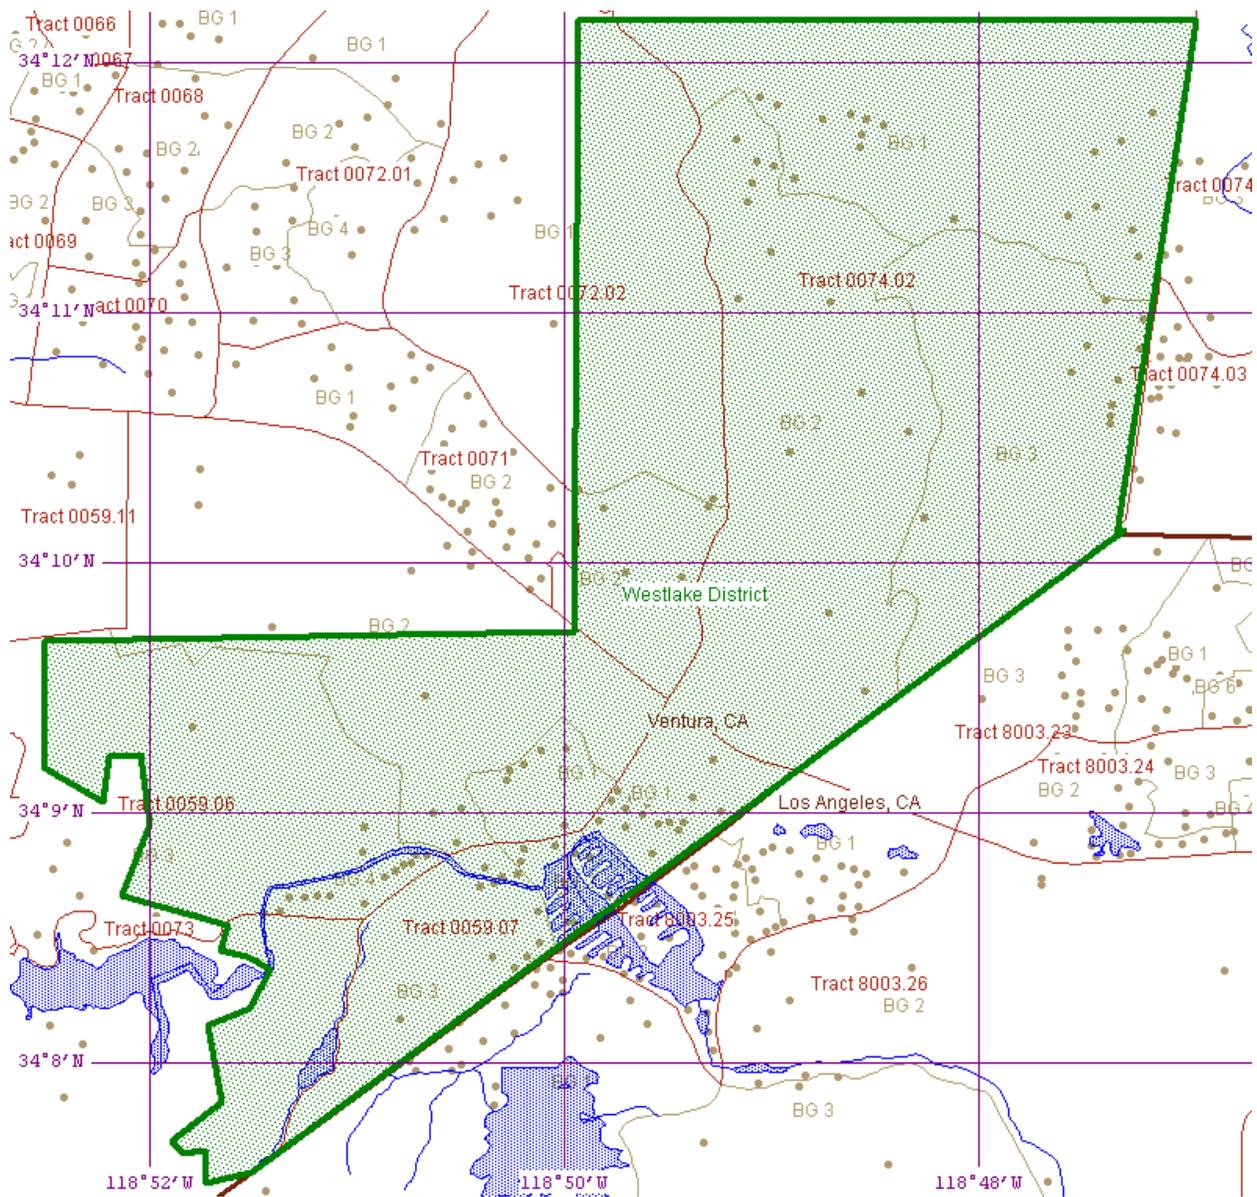

## 2.2 Service Area Population

Cal Water's Westlake District growth rate has remained slow since 1990. Currently, there are no new housing developments proposed. Any housing growth would probably be a result of redevelopment, which may also be limited due to growth restrictions imposed by the city. Growth in total services has averaged 0.07 percent in the past five years, and 0.16 percent for the past 10 years.

Based on 2000 U.S. Census data and considering actual service connection growth and assuming that density has remained unchanged since the census was conducted, Cal Water estimates that, as of December 2009, the District's population is approximately 16,740. A density of 2.33 persons per residential service (single family services plus multi family units) was used for this estimate.

The process for estimating population in the Westlake District began by overlaying the U.S. Census 2000 Block data with the Cal Water service area map (SAM), as shown in Figure 2.2-1.

Figure 2.2-1: Approximated SAM with US Census 2000 Tract Map

A summary of the census data for the year 2000 is shown in Table 2.2-1. LandView 5 and MARPLOT<sup>®</sup> software were used to generate the data<sup>3</sup>.

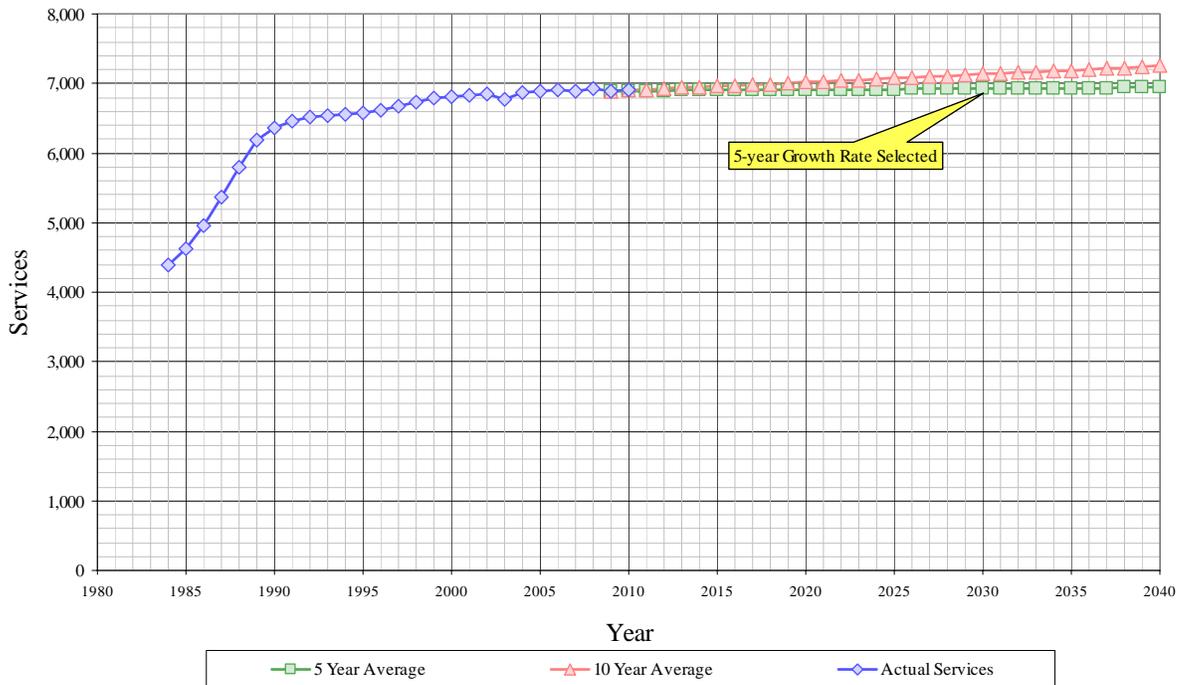

<sup>3</sup> LandView 5 and MARPLOT<sup>®</sup> software, US Census Bureau/Environmental Protection Agency, downloaded from: <http://www.census.gov/geo/landview/lv5/lv5.html>, <http://www.epa.gov/ceppo/comeo/marplot.htm>

Table 2.2-1: Summary of Census 2000 Data			
	Census Blocks	Population	Housing Units
Westlake Service Area	111	16,717	6,982

This data was used as a baseline for estimating population starting in 2000. To calculate estimated population after 2000, the Census 2000 population was then divided by the total number of dwelling units served by Cal Water in 2000 to produce a population density value. This value was then multiplied by the number of Cal Water dwelling units in each year.

To establish a range of future service counts the five-year and ten year projected growth rates for each service type were continued through 2040. The projection using the five year growth rate had the strongest correlation with past growth and was used to calculate projected services. A comparison of service connection growth rates is shown in Figure 2.2-2.

Figure 2.2-2: Historical & Projected Services

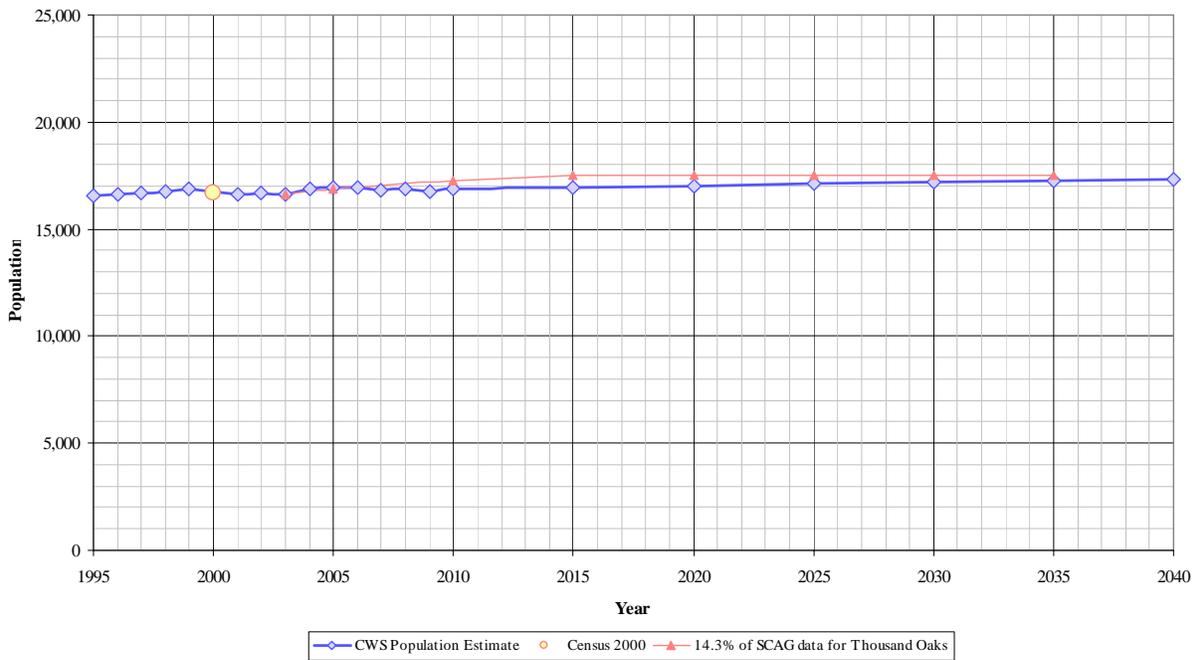

Based on this information, Cal Water estimates the service area’s population could reach 17,330 by 2040. Table 2.2-2 lists the population growth in 5-year increments.

Table 2.2-2: Population - Current and Projected (Table 2)								
	2005	2010	2015	2020	2025	2030	2035	2040
<b>Service Area Population</b>	16,910	16,880	16,960	17,030	17,110	17,180	17,260	17,330

The population estimate for the District was compared to the projection made by the Southern California Association of Governments (SCAG)<sup>3</sup>, as shown in Figure 2.2-3.

Figure 2.2-3: Estimated Population Comparison

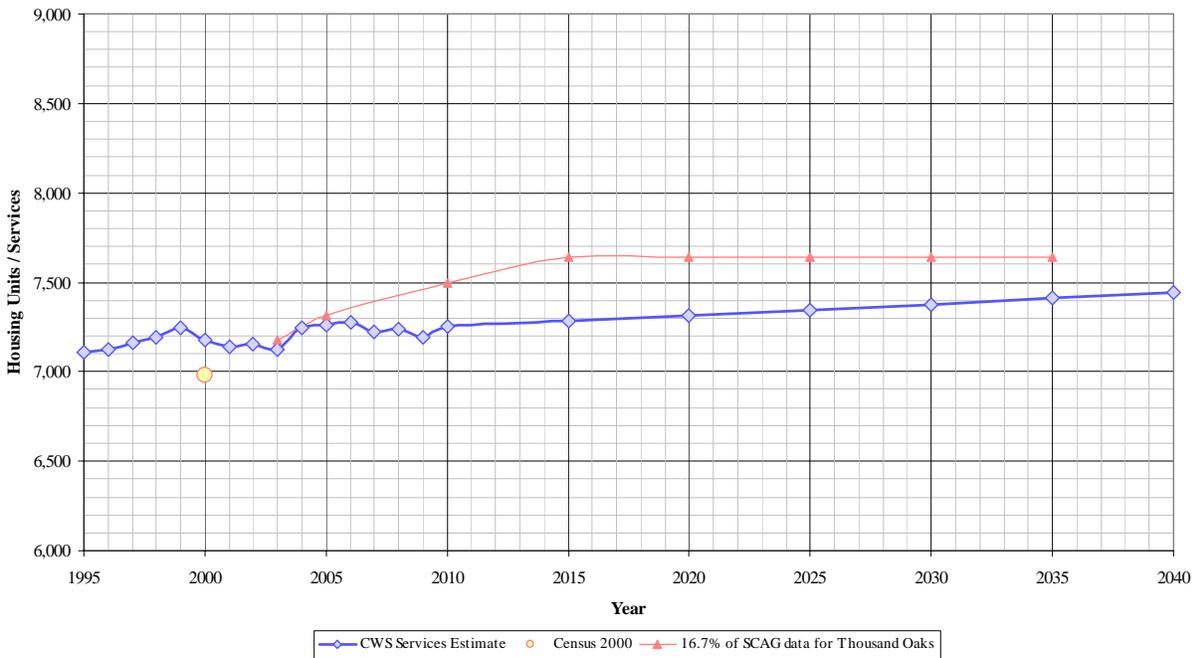

The total population for City of Thousand Oaks was estimated by SCAG to be 117,400 persons. According to 2000 US Census Data the population of the Westlake District makes up 14.3 percent of this total. The same percentage was used throughout the given time frame to determine the population projection based on growth rate as estimated by SCAG. The growth rate projected by the SCAG is shown to be increasing at

<sup>3</sup> Southern California Association of Governments (SCAG) Website, downloaded from: <http://www.scag.ca.gov/forecast/downloads/2004GF.xls>

approximately the same rate than has been experienced in the Westlake District since the 1990's.

Similarly, the housing count was estimated by comparing the US Census 2000 data and the service counts for the Westlake District, Figure 2.2-4. The service count for the year 2000 is slightly lower than the US Census 2000 dwelling units estimate. This is a result of multiple service connections that serve single housing units. The US Census 2000 housing units was established by summarizing the individual census blocks enclosed within the service area of the District.

**Figure 2.2-4: Estimated Housing Comparison**

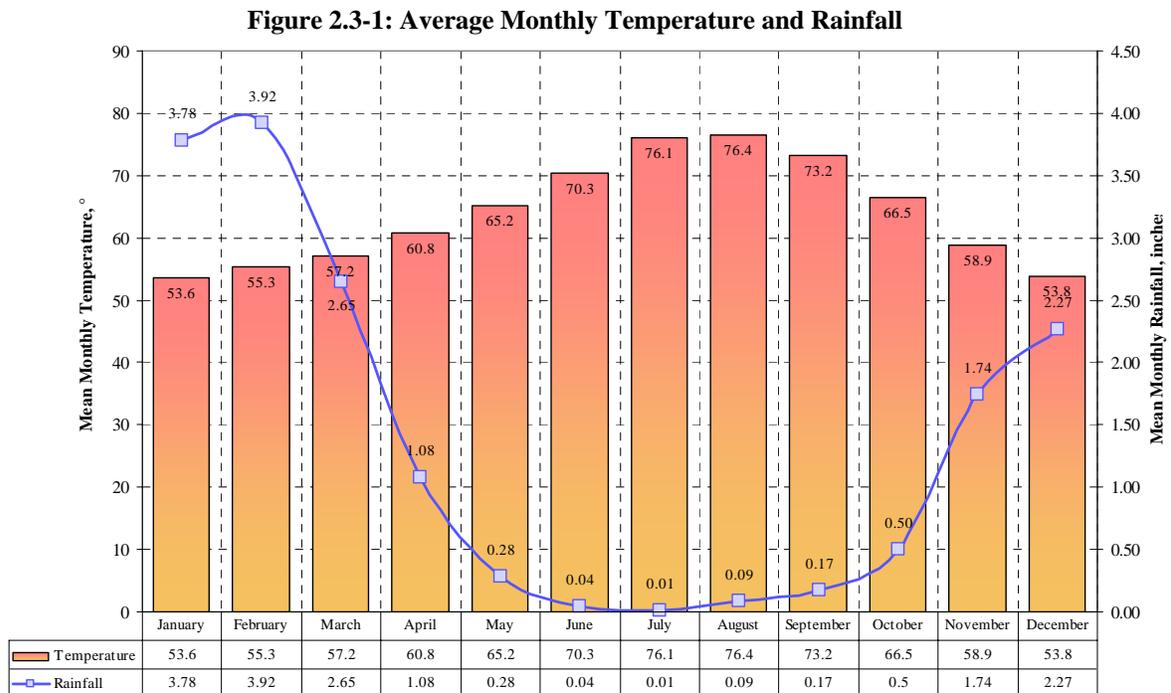

The growth rate used by SCAG is greater than the rate projected by Cal Water as shown in the above figure. The growth projected given by SCAG assumes this growth to occur within the City of Thousand Oaks, but not necessarily within the service area of Westlake District.

### 2.3 Service Area Climate

The climate for the Westlake District is moderate with warm dry summers and cool winters. The majority of precipitation falls during late autumn, winter, and early spring. Table 2.3-1 lists the average annual conditions at Woodland Hills, which is the closest weather station to Westlake District with a complete record. Additional climate data is provided in the Appendix C, worksheet 18.

Table 2.3-1: Average Annual Climate		
Average Temperature	Average Rainfall	Annual Total Evapotranspiration
63.9°F	16.5 inches	46.3 inches

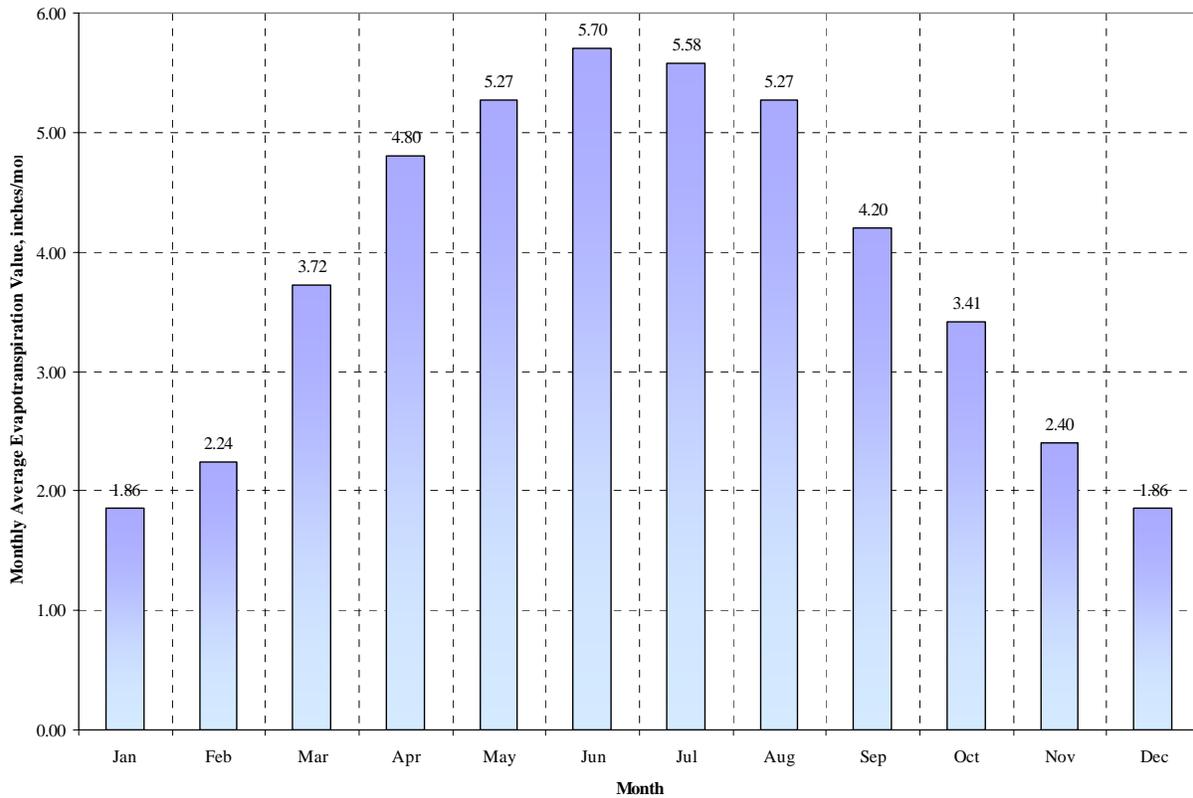

Figure 2.3-1 displays the average monthly temperature and rainfall<sup>5</sup>.

<sup>5</sup> Western Regional Climate Center, Westlake WSO Airport Weather Station, <http://www.wrcc.dri.edu/cgi-bin/cliMAIN.pl?cacano>

Figure 2.3-2 displays the monthly average evapotranspiration values for the area of the District<sup>6</sup>. Evapotranspiration is the sum of water loss from a watershed because of the processes of evaporation from the earth’s surface and transpiration from plant leaves. The annual estimated transpiration for Westlake is 46.3 inches. The average annual rainfall of 16.5 inches is only 36 percent of the annual total evapotranspiration value. This indicates that the Westlake District is located in a water-deficient environment.

**Figure 2.3-2: Monthly Average ETo Values**

<sup>6</sup> California Irrigation Management Information System (CIMIS), EvapoTranspiration (Eto) Zones Map - Zone 15, <http://www.cimis.water.ca.gov/cimis/welcome.jsp>

### 3 System Demands

---

#### 3.1 Distribution of Services

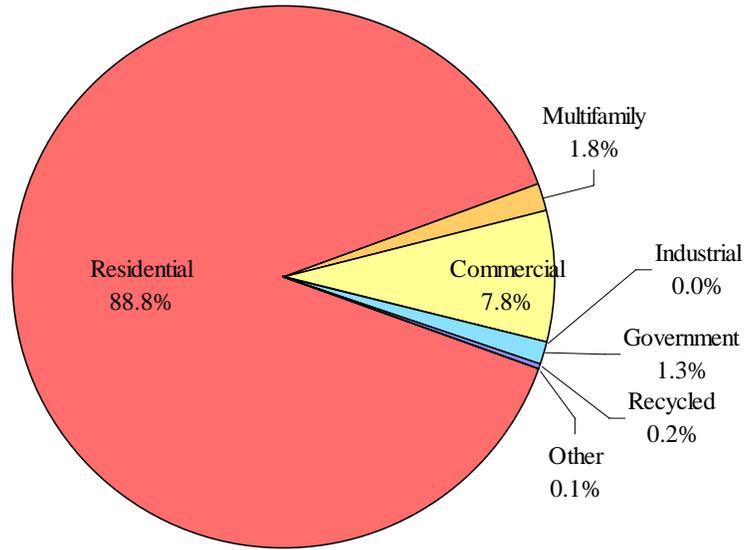

Cal Water designates the different customer connections as follows:

- ◆ Residential
- ◆ Multifamily
- ◆ Commercial
- ◆ Industrial
- ◆ Government
- ◆ Other

The Westlake District provides water service to almost 7,000 customers in the City of Thousand Oaks. Cal Water acquired the system in 1983 when it consisted of approximately 4,300 services. Growth in total services has averaged 0.07 percent in the past five years. This growth rate is expected to remain low due to the limited available land within the District's service area that can sustain development. Much of the remaining developable property in the District has poor accessibility and developers have not been able to obtain the required permits. Therefore, Cal Water does not anticipate any significant growth in the future, except for in-fill development.

The average annual service count for the calendar year 2010 was 6,911. Single-family residential services at 6,139 represent 88.8 percent of all services, multifamily residential services at 125 represent 1.8 percent, commercial at 535 services represents 7.8 percent, governmental services at 89 (1.3 percent), recycled services at 15 (0.2 percent), and other services at 7 (0.1 percent). The distribution of services for 2010 is shown graphically in Figure 3.1-1

Figure 3.1-1: Distribution of Services (2010)

### 3.2 Historical and Current Water Demand

Historical sales values are illustrated in Figure 3.2-1. Historical Service Counts are illustrated in Figure 3.2-2.

Figure 3.2-1: Historical Sales

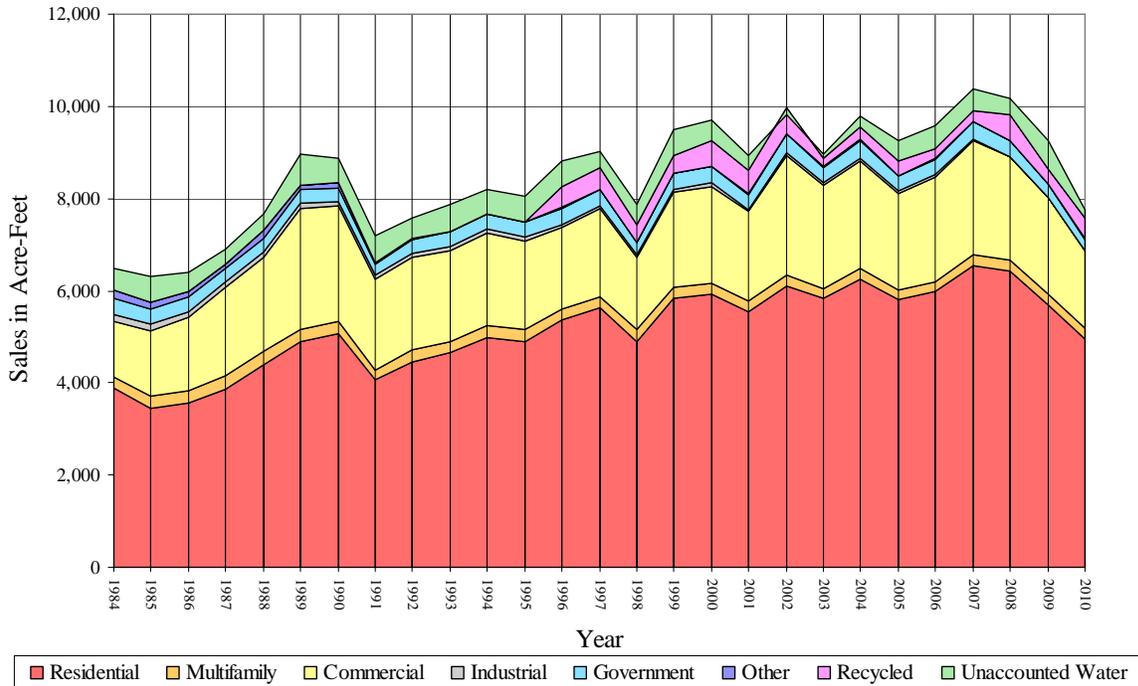

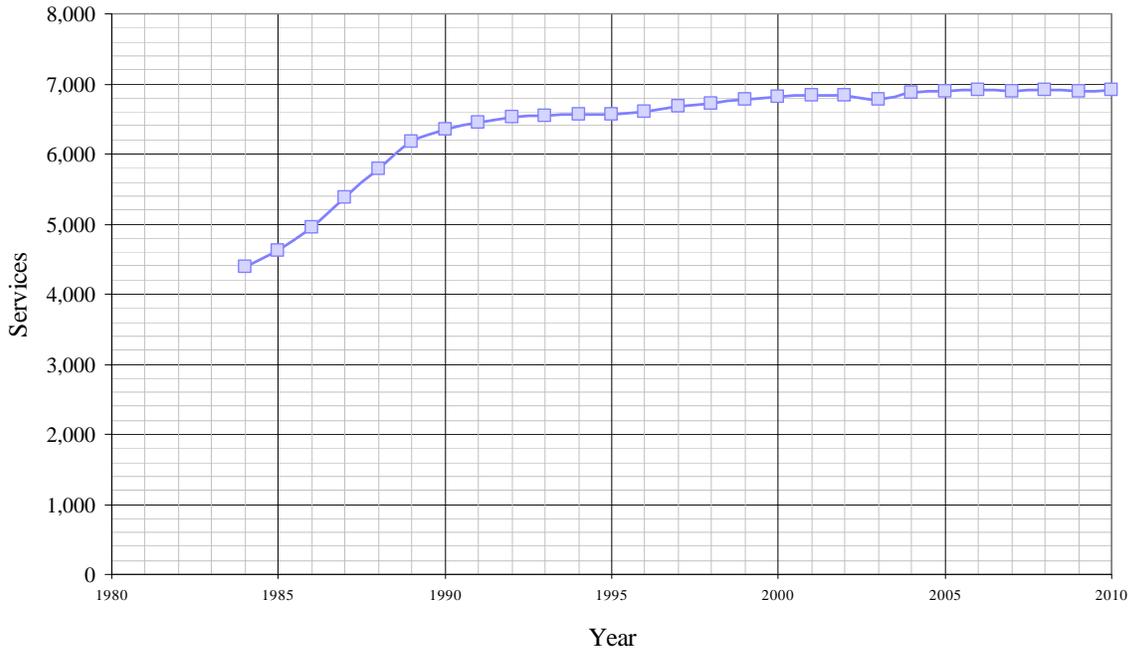

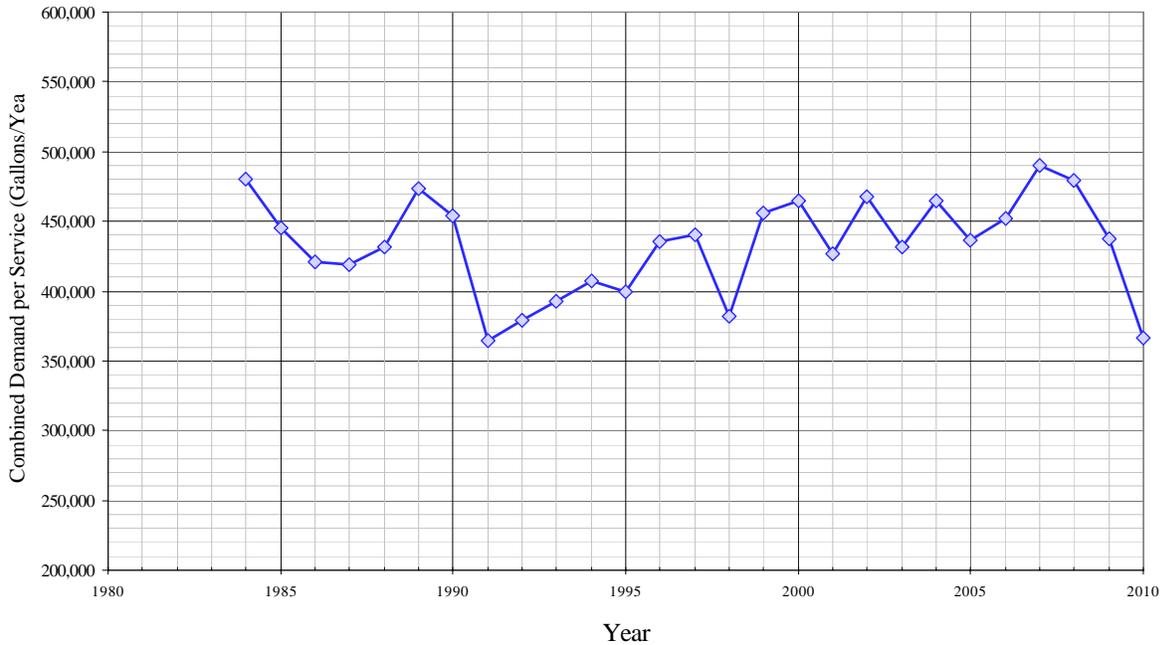

Figure 3.2-2: Historical Service Counts

Demand per service was established as a function of historical sales and service data. The annual demand per service of the District is indicative of an area of high water consumption. While no two water systems are completely comparable, it has been observed in similar highly residential suburban water districts operated by Cal Water that the annual residential demand per service typically is between 150,000 and 250,000 gallons per service per year, but in Westlake the residential demand per service averages over 300,000. This high demand per service is explainable by the fact that the community is comprised of spacious homes on large, well-landscaped lots located in a very arid environment.

The combined demand for all services fluctuates between 360,000 to 480,000 gallons per service per year, as shown in Figure 3.2-3.

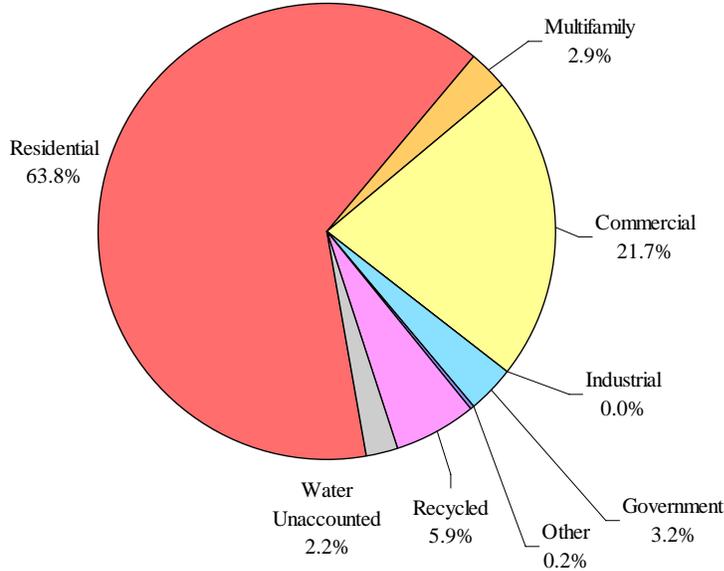

**Figure 3.2-3: Historical Demand per Service**

The residential customers in the District were able to respond to the mandate for water conservation in 1991 by reducing the demand per service consumption by nearly 21 percent over 1990's level of consumption. When combined with the reductions by other service categories, this resulted in an overall conservation reduction in total demand of 19.7 percent over the regional base year of 1989, and 18.7 over the demand of 1990. Since 1991 demand has steadily increased to pre-drought levels. Since then, demand has risen steadily to pre-drought levels. More recently, demand was reduced sharply almost to historic lows as a result of drought conditions from 2006-2009.

Single-family residential water use represents the smallest demand per service segment in the District at 323,000 gallons per service per year, yet this category uses 64 percent of the total demand. The multifamily residential use was 3 percent of the total demand with a typical demand per service of 1 million gallons per service per year. The combined residential sector component of demand is equal to 67 percent of total demand. Figure 3.2-4 displays the percent of total demand by type of use.

Figure 3.2-4: Percent of Total Demand by Type of Use (2010)

### 3.3 Water Demand Projections

Cal Water has historically made its water demand projections by first calculating individual growth rates for each of its service connection types. These growth rates were based on five or ten year averages of service count data, and were extended over the planning horizon resulting in projected service counts. A set of three demand per service values (low, average, high), which were based on past customer usage records, were then applied to the projected service counts to calculate projected water demands for each service type. Due to the passage of Senate Bill 7 (SBx7-7) this method is no longer used as the primary method for calculating projected demands. However, these calculations are still used as the basis for calculating projected services, population, and the distribution of demand amongst service connection types.

The method used in this UWMP to determine future water demands is a response to SBx7-7 requirements. It results in two demand projections; the unadjusted baseline demand, and the target demand. The unadjusted baseline water demand projection is the

total demand expected without any achieved conservation. It is equal to forecasted population multiplied by the 2005-09 average, or 498 gpcd.

The target water demand projection includes conservations savings due to both passive and active demand management, which are described in Section 6. The target demand is calculated by multiplying SBx7-7 target gpcd values and projected population. These conservation savings are illustrated in the comparison of projected demands shown in Figure 3.3-1.

Figure 3.3-1: Historical & Projected Demand

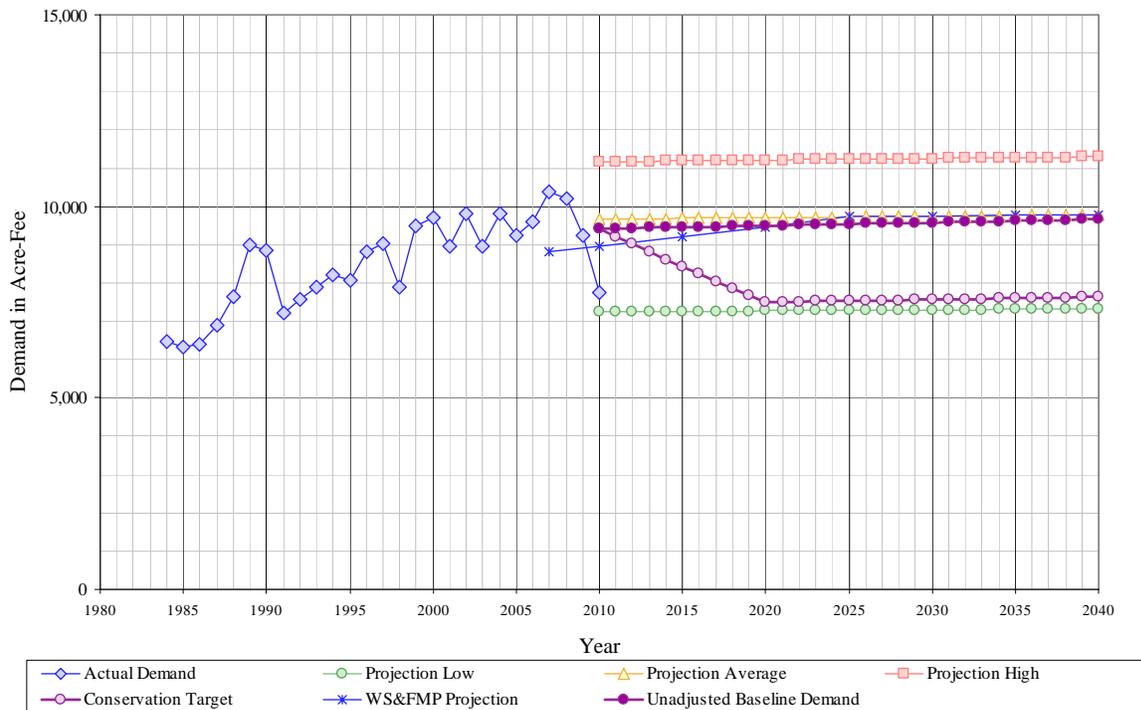

Figure 3.3-1 also shows the demand projection developed in Cal Water’s Water Supply and Facilities Master Plan for the Westlake District. In this case water demands were projected through full buildout of the Westlake District using a unit demand methodology based on land uses in the City’s General Plan. This projection calculates demands based on past water use levels. It is included here to provide a comparison to demands calculated for the purposes of SBx7-7 compliance.

The water demand projection calculation used for SBx7-7 compliance relies only on future population and gpcd target values. Projected water deliveries separated by customer type can not be determined by this method alone. To get a breakdown of future deliveries Cal Water used the ratio of individual deliveries for each class to the total amount that was developed for the previously used water demand projection. This ratio was applied to the total adjusted baseline demand, which resulted in the projected

deliveries listed in Tables 3.3-1 through 3.3-6. These demands include the conservation savings associated with the demand management measures described in Section 6.

### 3.3.1 Senate Bill No. 7 Baselines and Targets

Cal Water is in the process of expanding current conservation programs and developing new programs for its 24 service districts. Over the next five years, Cal Water conservation program expenditures are likely to increase significantly due in large measure to recently adopted state policies requiring significant future reductions in per capita urban water use. These include the passage of Senate Bill No. 7 (SBx7-7) in November 2009, which mandated a statewide 20 percent reduction in per capita urban water use by 2020, as well as recent decisions by the California Public Utilities Commission (CPUC) directing Class A and B water utilities to adopt conservation programs and rate structures designed to achieve reductions in per capita water use, and the *Memorandum of Understanding Regarding Urban Water Conservation in California* (MOU), of which Cal Water has been a signatory since 1991. In preparing for this program expansion, Cal Water has spent the past year developing five-year conservation program plans for each of its service districts. The complete Westlake District Conservation Master Plan is included as Appendix G.

SBx7-7, which was signed into law in November 2009, amended the State Water Code to require a 20 percent reduction in urban per capita water use by December 31, 2020. Commonly known as the 20x2020 policy, the new requirements apply to every retail urban water supplier subject to the Urban Water Management Planning Act (UWMPA).

The state is required to make incremental progress toward this goal by reducing per capita water use by at least 10 percent on or before December 31, 2015. SBx7-7 requires each urban retail water supplier to develop interim and 2020 urban water use targets in accordance with specific requirements. They will not be eligible for state water grants or loans unless they comply with those requirements.

The law provides each water utility several ways to calculate its interim 2015 and ultimate 2020 water reduction targets. In addition, water suppliers are permitted to form regional alliances and set regional targets for purposes of compliance. Under the regional compliance approach, water suppliers within the same hydrologic region can comply with SBx7-7 by either meeting their individual target or being part of a regional alliance that meets its regional target. For all Cal Water districts falling within the same hydrologic region, Cal Water intends to enter regional alliances as listed in Table 3.3-7. The Westlake District lies within the South Coast hydrologic region, along with Dominguez, East Los Angeles, Hermosa Redondo, and Palos Verdes Districts.

<b>Hydrologic Region</b>	<b>Cal Water Districts in Region</b>
North Coast	Redwood Valley
San Francisco Bay Area	Bear Gulch, Livermore, Los Altos, Mid- Peninsula, South San Francisco
Central Coast	King City, Salinas
South Coast	Dominguez, East LA, Hermosa-Redondo, Palos Verdes, <b>Westlake</b>
Sacramento River	Chico, Dixon, Marysville, Oroville, Willows
San Joaquin	Stockton
Tulare Lake	Bakersfield, Kern River Valley, Selma, Visalia
North Lahontan	None
South Lahontan	Antelope Valley
Colorado River	None

District-specific and regional targets for Cal Water districts within the South Coast hydrologic region are shown in Table 3.3-8. The 2015 and 2020 district-specific targets for Westlake District are 442 and 393 gpcd, respectively. Over the last five years District demand has averaged about 498 gpcd. Per capita water use in the District is 259 percent of statewide average urban per capita water use. The District's high per capita water use is expected to make compliance with state legislation more difficult. Alternatively, for regional compliance, demand for the five Cal Water districts within the South Coast hydrologic region can average no more than 176 gpcd in 2015 and 160 gpcd in 2020.

<b>District</b>	<b>Population</b>	<b>2015 Target</b>	<b>2020 Target</b>
Dominguez	144,190	193	171
East Los Angeles	148,740	121	115
Hermosa-Redondo	94,070	134	126
Palos Verdes	67,620	253	225
Westlake	16,740	442	393
<b>Regional Targets<sup>1</sup></b>		<b>176</b>	<b>160</b>

<sup>1</sup> Regional targets are the population-weighted average of the district targets.

The following analysis presents the individual SBx7-7 compliance targets for the Westlake District.

Under SBx7-7, an urban retail water supplier may adopt one of four different methods for determining the 2020 gpcd target:

1. Set the 2020 target to 80 percent of average GPCD for any continuous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.
2. Set the 2020 target as the sum of the following:
  - a. 55 GPCD for indoor residential water use.
  - b. 90 percent of baseline CII water uses, where baseline CII GPCD equals the average for any contiguous 10-year period ending no earlier than December 31, 2004, and no later than December 31, 2010.
  - c. Estimated per capita landscape water use for landscape irrigated through residential and dedicated irrigation meters assuming water use efficiency equivalent to the standards of the Model Water Efficient Landscape Ordinance set forth in Section 2.7 of Division 2 of Title 23 of the California Code of Regulations.
3. Set the 2020 target to 95 percent of the applicable state hydrologic region target, as set forth in the state's draft 20x2020 Water Conservation Plan (dated April 30, 2009).
4. A method determined by DWR through the urban stakeholder process.

For district-specific SBx7-7 compliance, targets were set to either 80 percent of baseline gpcd (Method 1) or 95 percent of the District's hydrologic region target (Method 3), whichever was greater. An analysis for Method 2 was not performed due to a lack of data necessary for this method. Method 4 was also not considered because it was not available when the Conservation Master Plan process began.

Under Method 1, the 2015 and 2020 targets are set to 90 percent and 80 percent of baseline water use, respectively. Baseline water use is the average water use for any continuous 10-year period ending between 2004 and 2010. For the Westlake District, the 10-year base period 1999-2008 yielded the maximum target under this method. The 2015 target is 442 gpcd and a 2020 target is 393 gpcd. Table 3.3-9 summarizes the base period ranges and Table 3.3-10 lists the per capita demand over the ten-year base period.

<b>Table 3.3-9: Base Period Ranges (Table 13)</b>			
<b>Base</b>	<b>Parameter</b>	<b>Value</b>	<b>Units</b>
10-15-year base period	2008 total water deliveries	9,810	AF
	2008 total volume of delivered recycled water	582	AF
	2008 recycled water use as a percent of total deliveries	5.6	%
	Number of years in base period	10	years
	Year beginning base period range	1999	
	Year ending base period range	2008	
5-year base period	Number of years in base period	5	years
	Year beginning base period range	2004	
	Year ending base period range	2008	

<b>Table 3.3-10: Daily Base Per Capita Water Use-10-Year Range (Table 14)</b>				
<b>Base Period Year</b>		<b>Distribution System Population</b>	<b>Daily System Gross Water Use (mgd)</b>	<b>Annual Daily Per Capita Water Use (gpcd)</b>
<b>Sequence Year</b>	<b>Calendar Year</b>			
Year 1	1999	16,870	8.2	484
Year 2	2000	16,720	8.2	490
Year 3	2001	16,630	7.6	454
Year 4	2002	16,660	8.3	496
Year 5	2003	16,600	7.8	472
Year 6	2004	16,870	8.5	503
Year 7	2005	16,910	8.0	471
Year 8	2006	16,950	8.3	491
Year 9	2007	16,820	9.1	543
Year 10	2008	16,850	8.6	509
<b>Base Daily Per Capita Water Use</b>				<b>491</b>

Under Method 3, the 2015 and 2020 targets are set to 95 percent of the 2015 and 2020 targets for the hydrologic region in which the district is located. Because the Westlake District is located in the South Coast hydrologic region the Westlake District's 2015 target is 179 gpcd and the 2020 target is 163 gpcd.

The SBx7-7 target for 2020 cannot exceed 95 percent of the District’s five-year baseline water use, where the baseline period ends no earlier than December 31, 2007 and no later than December 31, 2010. The District’s 2020 target cannot exceed this level, regardless of which method is used to calculate it. The maximum allowable target in the Westlake District is 478 gpcd, as shown in Table 3.3-11. In this case, neither target calculation method results in a target exceeding the maximum allowable target, so no adjustment is necessary.

<b>Table 3.3-11: Daily Base Per Capita Water Use-5-Year Range (Table 15)</b>				
<b>Base Period Year</b>		<b>Distribution System Population</b>	<b>Daily System Gross Water Use (mgd)</b>	<b>Annual Daily Per Capita Water Use (gpcd)</b>
<b>Sequence Year</b>	<b>Calendar Year</b>			
Year 1	2004	16,870	8.49	503
Year 2	2005	16,910	7.96	471
Year 3	2006	16,950	8.33	491
Year 4	2007	16,820	9.13	543
Year 5	2008	16,850	8.57	509
<b>Base Daily Per Capita Water Use</b>				<b>503</b>

Based on the results of this analysis as shown in Table 3.3-12, the Method 1 targets were chosen for the Westlake District.

<b>Table 3.3-12. Westlake District SBx7-7 Targets</b>	
<b>Maximum Allowable Target</b>	
Base Period:	2004-2008
Per Capita Water Use:	503

Hydrologic Region:	South Coast
2015 Target:	157
2020 Target:	142
<b>Selected District Target</b>	
2015 Target:	442
2020 Target:	393

### 3.3.2 Low Income Housing Projected Demands

California Senate Bill No. 1087 (SB 1087), Chapter 727, was passed in 2005 and amended Government Code Section 65589.7 and Water Code Section 10631.1. SB 1087 requires local governments to provide a copy of their adopted housing element to water and sewer providers. In addition, it requires water providers to grant priority for service allocations to proposed developments that include housing units for lower income families and workers. Subsequent revisions to the Urban Water Management Planning Act require water providers to develop water demand projections for lower income single and multi-family households.

Cal Water does not maintain records of the income level of its customers and does not discriminate in terms of supplying water to any development. Cal Water is required to serve any development that occurs within its service area, regardless of the targeted income level of the future residents. It is ultimately the City's or County's responsibility to approve or not approve developments within the service area.

For the purposes of estimating projected demands from low income households, Cal Water drew information from The Housing Element for City of Thousand Oaks. According to the Housing Element, 4.4 percent of homeowners and 12.6 percent of renters are in the lowest income group.<sup>4</sup> These percentages were applied to the projected demand for Cal Water's single family and multi-family customers, respectively, to estimate low income projected demands.

<b>Low Income Water Demands</b>	<b>2015</b>	<b>2020</b>	<b>2025</b>	<b>2030</b>	<b>2035</b>	<b>2040</b>
Single-family residential	217	193	194	194	195	196
Multi-family residential	28	25	25	26	26	26
<b>Total</b>	<b>245</b>	<b>218</b>	<b>219</b>	<b>220</b>	<b>221</b>	<b>222</b>

As a benefit to our customers, Cal Water offers its Low Income Rate Assistance Program (LIRA) in all of its service districts. Under the LIRA Program qualified customers are able to receive a discount on their monthly bills.

<sup>4</sup> "2006-2014 Housing Element, Thousand Oaks General Plan", City of Thousand Oaks, April 13, 2010, Page 11

### 3.4 Total Water Use

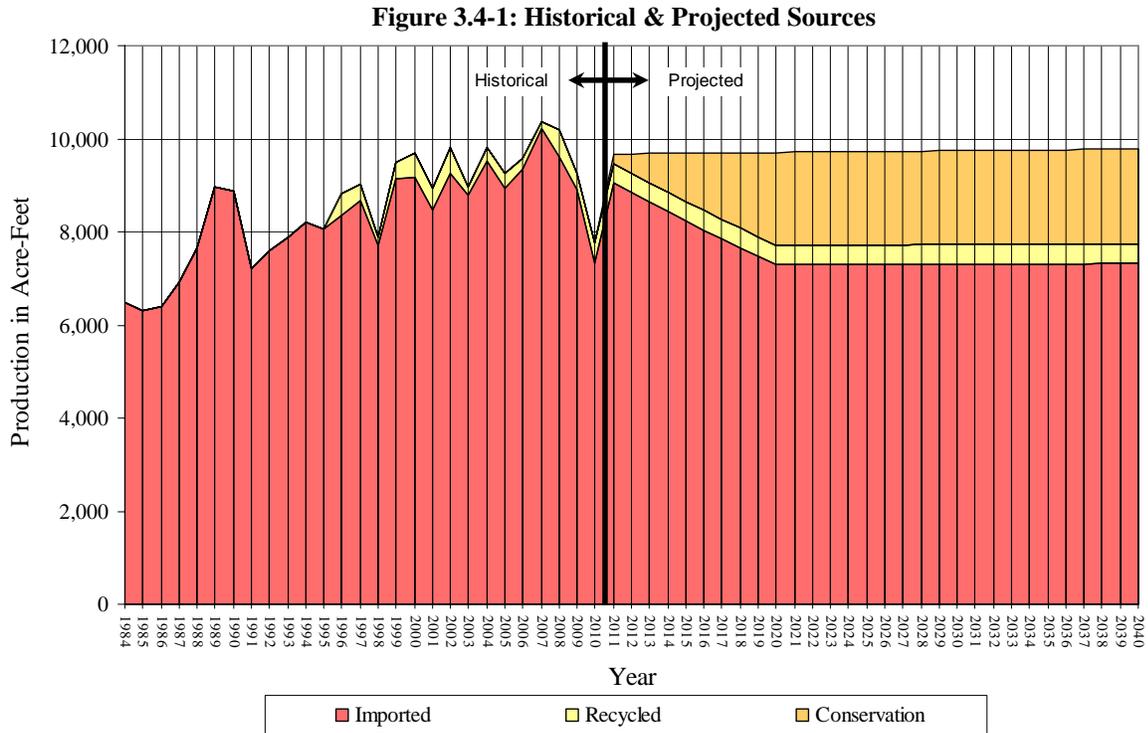

Cal Water does not currently sell water to other agencies, nor does it provide water for saline barriers, groundwater recharge, or conjunctive use. The potential additional water uses within Cal Water's service area are discussed and quantified in Section 4. For the purposes of this UWMP it is assumed that the only water sales to customers and distribution system losses are included in the total demand. The recycled water sales and system losses are summarized in Table 3.4-1.

Water Use	2010	2015	2020	2025	2030	2035	2040
Sales to Other Agencies	-	-	-	-	-	-	-
Saline barriers	-	-	-	-	-	-	-
Groundwater recharge	-	-	-	-	-	-	-
Conjunctive use	-	-	-	-	-	-	-
Raw water	-	-	-	-	-	-	-
Recycled	460	421	422	424	425	427	428
Unaccounted-for system losses	462	552	492	493	495	497	499
<b>Total</b>	922	973	914	917	920	924	927

Actual and projected water use through 2040 is shown in Table 3.4-2. The values represent the total target demand projection based on SBx7-7 gpcd targets, including recycled water and unaccounted for water.

	2005 (Actual)	2010 (Actual)	2015	2020	2025	2030	2035	2040
<b>Water Use</b>	9,406	8,052	8,837	7,919	7,956	7,988	8,025	8,057

Figure 3.4-1 shows the planned sources of supply based on these demands through 2040. At this time only purchased water, recycled water, and conservation are included as sources of supply. Cal Water’s efforts to secure alternative supplies are discussed in the following section.

## 4 System Supplies

### 4.1 Water Sources

The water supply for the customers of the Westlake District is a combination of purchased imported water and recycled water. Purchased water provides the majority of the total supply while recycled water makes up the remaining portion. According to the Draft 2010 Calleguas Municipal Water District (CMWD) UWMP, there will be sufficient supplies to meet all future projected demands through 2035. Because of this Cal Water assumes that its total imported supplies will equal its projected demand minus the projected recycled water use. The projected water supply sources and amounts shown in Table 4.1-1. are based on the SBx7-7 target demands.

<b>Water Supply Sources</b>	<b>2010 Actual</b>	<b>2015</b>	<b>2020</b>	<b>2025</b>	<b>2030</b>	<b>2035</b>	<b>2040</b>
<b>Calleguas Municipal Water District</b>	7,339	7,995	7,075	7,108	7,138	7,171	7,201
<b>Supplier produced groundwater</b>	-	-	-	-	-	-	-
<b>Transfers in or out</b>	-	-	-	-	-	-	-
<b>Exchanges In or out</b>	-	-	-	-	-	-	-
<b>Recycled Water (projected use)</b>	419	421	422	424	425	427	428
<b>Desalination</b>	-	-	-	-	-	-	-
<b>Total</b>	<b>7,758</b>	<b>8,416</b>	<b>7,497</b>	<b>7,532</b>	<b>7,563</b>	<b>7,598</b>	<b>7,629</b>

### 4.2 Purchased Water

The imported water is purchased from the CMWD, which is a member agency of the Metropolitan Water District of Southern California (MWD). This water is imported into southern California through Metropolitan's connections to the State Water Project. CMWD acts as a secondary wholesale water agency, purchasing the water from Metropolitan and reselling it to Cal Water.

The last purchase agreement between Cal Water and CMWD began in 2003 and has a ten year term. Cal Water expects this purchase agreement to be renewed as necessary. The initial base demand in each agreement is set as the highest annual demand over the preceding ten fiscal years. Cal Water's Tier I maximum is set at 90 percent of the base demand. Any purchases over this amount will be in Tier II pricing. Cal Water also has a minimum purchase order commitment over the length of the agreement which must be met. According to the agreement Cal Water has an initial base demand of 9,481 AFY, a Tier I maximum of 8,533 AFY, and a purchase order commitment of 56,887 AF.

The amount of potable water Cal Water estimates it will need to from CMWD to meet customer demand is shown in Table 4.2-1.

<b>Wholesale Source</b>	<b>Contracted Volume</b>	<b>2015</b>	<b>2020</b>	<b>2025</b>	<b>2030</b>	<b>2035</b>	<b>2040</b>
Callguas Municipal Water District	9,481	7,995	7,075	7,108	7,138	7,171	7,201

### 4.3 Surface Water

The Potrero Valley Creek runs through the District service area and may be a potential source of water to the District. Lake Sherwood is a reservoir with capacity of 2,600 acre-ft with a dam that was constructed in 1904 and is owned by the Sherwood Country Club. Water flows from Lake Sherwood into Potrero Valley Creek and subsequently into Westlake. Westlake is owned by the Westlake Lake Management Association, which has rights to up to 1,500 acre-ft/yr for purposes of filling and maintaining the level in Westlake. Las Virgenes Municipal Water District has rights to 1,030 acre-ft/yr in Triunfo Canyon Creek below Westlake.

While it is not believed that there are any available water rights to the local surface water, it may be possible to obtain some water rights via trade or exchange of groundwater, increasing the yield of local potable or non-potable water for the District. Further studies are recommended to evaluate the feasibility of the use of local surface water supplies.

### 4.4 Groundwater

Groundwater is not being used as a source for the District. Groundwater is not thought to be a viable supply due to the low conductivity of much of the basin and because of water quality concerns. Local groundwater has been found to contain high levels of total dissolved solids, iron and manganese, and other naturally occurring minerals.

#### 4.4.1 Basin Boundaries and Hydrology

The Thousand Oaks Area Groundwater Basin underlies a small valley between Lake Sherwood and Thousand Oaks in southeastern Ventura County and western Los Angeles County. The basin is bounded by semi-permeable rocks of the Santa Monica Mountains. The valley is drained by Conejo Creek and Triunfo Canyon. Even though the basin may be able to maintain wells outside of the service area, wells located within the District service area would not have practical flow rates.

The above description and additional details of the basin are given in the DWR Groundwater Bulletin 118, see Appendix D<sup>7</sup>.

<sup>7</sup>California Department of Water Resources, California's Ground Water Bulletin 118, 2003

#### **4.4.2 Groundwater Management Plan**

There is no Groundwater Management Plan for the basin. In addition, Cal Water does not have any groundwater wells within the Westlake District. CMWD relies principally on purchased MWD water, supplemented by groundwater wells. CMWD has several programs to maintain the groundwater supply, which may indirectly benefit Cal Water. The 2005 Calleguas Water Management Plan contains information regarding regional programs to increase or maintain water supply.

#### **4.5 Recycled Water**

The recycling of wastewater offers several potential benefits to Cal Water and its customers. The greatest benefit is reducing potable supply needs by utilizing recycled water for appropriate uses (e.g., landscape, irrigation) now being served by potable water. The potential amount of recycled water that can be produced is proportional to the amount of wastewater that is generated by the District, and is discussed in the following sections.

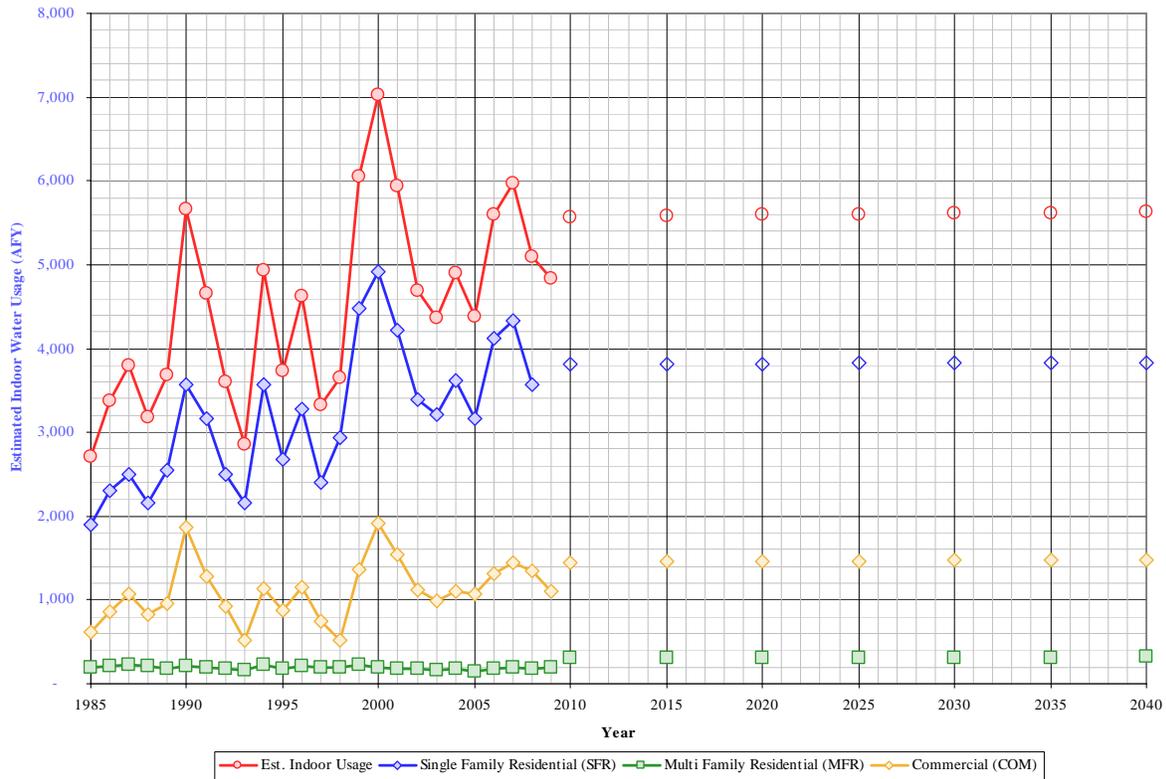

##### **4.5.1 Wastewater Collection**

The Tapia Water Reclamation Facility, owned and operated by Las Virgenes Municipal Water District, provides the wastewater service and recycled water for the Westlake District service area. The wastewater at the Tapia Water Reclamation Facility undergoes tertiary treatment with sand filtration and chlorination. Las Virgenes Municipal Water District has a joint venture with Triunfo Sanitation District. The ownership of the recycled water changes to Triunfo in Ventura County. CMWD then purchases the recycled water from Triunfo. During the summer months, 100 percent of the treated effluent from the Tapia Water Reclamation Facility is recycled for irrigation of commercial property, parks, golf courses, and school grounds. Wastewater is not recycled during the winter months, but is discharged to Malibu Creek. The Tapia Water Reclamation Facility currently treats 10.5 million gallons per day of wastewater.

##### **4.5.2 Estimated Wastewater Generated**

Estimates for the District's wastewater production quantity since 1985 are shown in Figure 4.5-1 and were calculated by annualizing 90 percent of January water use in Cal Water's service area. The future quantity of waste generation is based on a linear projection of the historical estimates.

Figure 4.5-1: Estimated District Annual Wastewater Generated

The estimated volume of wastewater generated for the District in five-year increments to the year 2040 is presented in Table 4.5-1.

Type of Wastewater	Treatment Level	2010	2015	2020	2025	2030	2035	2040
Total Collected and Treated	Tertiary	5,572	5,582	5,591	5,601	5,610	5,620	5,629
Volume Meeting Recycled Water Standard	Tertiary	5,572	5,582	5,591	5,601	5,610	5,620	5,629

Cal Water does not have data concerning all the recycled water use for other agencies in the area. So for the purposes of this UWMP, Cal Water assumes that all of the wastewater not returned to the service area as recycled water is discharged into Malibu Creek. Therefore, the values in Table 4.5-2 are equal to the total collected wastewater minus the Westlake District’s projected recycled water use.

Method of Disposal	Treatment Level	2010	2015	2020	2025	2030	2035	2040
Discharged to Malibu Creek during winter	Tertiary	5,156	5,164	5,172	5,180	5,188	5,196	5,204

### 4.5.3 Potential Water Recycling

It is not anticipated that new recycled water customers will be acquired in the near future unless new standards are approved by the State. All of the potential customers in the Westlake District already receive recycled water. The recycled water use (actual and projected) in the Westlake service area is summarized in Table 4.5-3.

User type	Treatment Level	2005	2010	2015	2020	2025	2030	2035	2040
<b>Agriculture</b>		-	-	-	-	-	-	-	-
<b>Landscape</b>	Tertiary	321	416	421	422	424	425	427	428
<b>Wildlife Habitat</b>		-	-	-	-	-	-	-	-
<b>Wetlands</b>		-	-	-	-	-	-	-	-
<b>Industrial/Commercial</b>		-	-	-	-	-	-	-	-
<b>Groundwater Recharge</b>		-	-	-	-	-	-	-	-
	<b>Total</b>	321	416	421	422	424	425	427	428

Currently, the demand for recycled water is so high during the summer months that it is supplemented with potable water for irrigation use. Cal Water has not implemented any incentive programs to encourage recycled water use because Cal Water does not own or operate the wastewater system; however, the recycled water supplier does offer a reduced rate which Cal Water does offer as a direct pass-through to the customer.

The Triunfo Sanitation District constructed a recycled water distribution system in the southern portion of the Westlake District, and CMWD constructed a recycled water distribution system in the North Ranch portion of the District. In an effort to consolidate the management and operation of these two systems, CMWD has purchased the South Ranch distribution pipeline and will be the sole wholesaler for all water supplies in the region.

Cal Water has signed an agreement for the purchase of water from these systems as the supplies become available. Deliveries in the South Ranch and North Ranch began upon completion of the distribution system in 1995. As the price of Metropolitan's potable supply increases, it will become economical to add additional services to the recycled water system and as a result, the sales should slowly increase. This recycled water use reduces the amount of imported potable water that must be purchased from MWD.

MWD assisted in the development of these recycled water projects through their Local Projects Program. Other local supply enhancement programs are offered by MWD that provide financial incentives for modifying and improving the operation of local water supplies. The Westlake District is unable to participate in these other programs because of the lack of other usable local supplies.

#### **4.6 Desalinated Water**

The Pacific Ocean is located a few miles away from the District, so the potential for seawater desalination exists. There are no known seawater desalination projects currently planned in the nearby region (Malibu, Port Hueneme, Oxnard, or Ventura), but these coastal cities would be the most likely opportunity for desalination. Due to the high cost of desalination supplies, it would not be feasible for the District to lead the pursuit of such a project. Even if such a project were constructed, it would be expensive to construct transmission and pump the water to the District. However, if such a project were constructed, it may free imported water demands from these coastal cities for use by the District. Therefore, if such a project were to be pursued by another entity, it is recommended that the District support and consider joining such a project to benefit the reliability of its water supplies.

#### **4.7 Transfer or Exchange Opportunities**

Cal Water is not pursuing any transfer or exchange opportunities at this time. If CMWD imported supplies were thought to be insufficient, Cal Water could pursue additional supplies from outside the area.

#### **4.8 Water Supply Projects**

Future water supplies will be provided by the Calleguas Municipal Water District. CMWD has worked to augment the reliability of imported water supplies. Cal Water will support that work whenever feasible.

Because growth potential is limited in the Westlake area, no major new facilities are planned. As new projects are developed or existing areas are redeveloped, additional facilities may be required. Reservoirs and pump stations will be upgraded in the capital budgets. A Water Supply and Facilities Master Plan was prepared in 2009, which outlines all the capital improvements recommended for the next 20 years.

---

## 5 Water Supply Reliability and Water Shortage Contingency Planning

---

### 5.1 Water Supply Reliability

As a result of investments made in conservation, water recycling, transfer agreements, storage, and supply, MWD expects to be able to meet forecasted CMWD demands. Therefore, CMWD also expects to be able to meet the forecasted purveyor demands. The strategies used to maintain this reliability are described below.

MWD adopted its first Integrated Resources Plan (IRP) in 1996, as a result of the 1987-1992 drought. The IRP is a long range planning document that focuses on improving reliability of regional water supplies by augmenting current supplies and creating or promoting alternative supplies. The IRP was last updated in 2010.

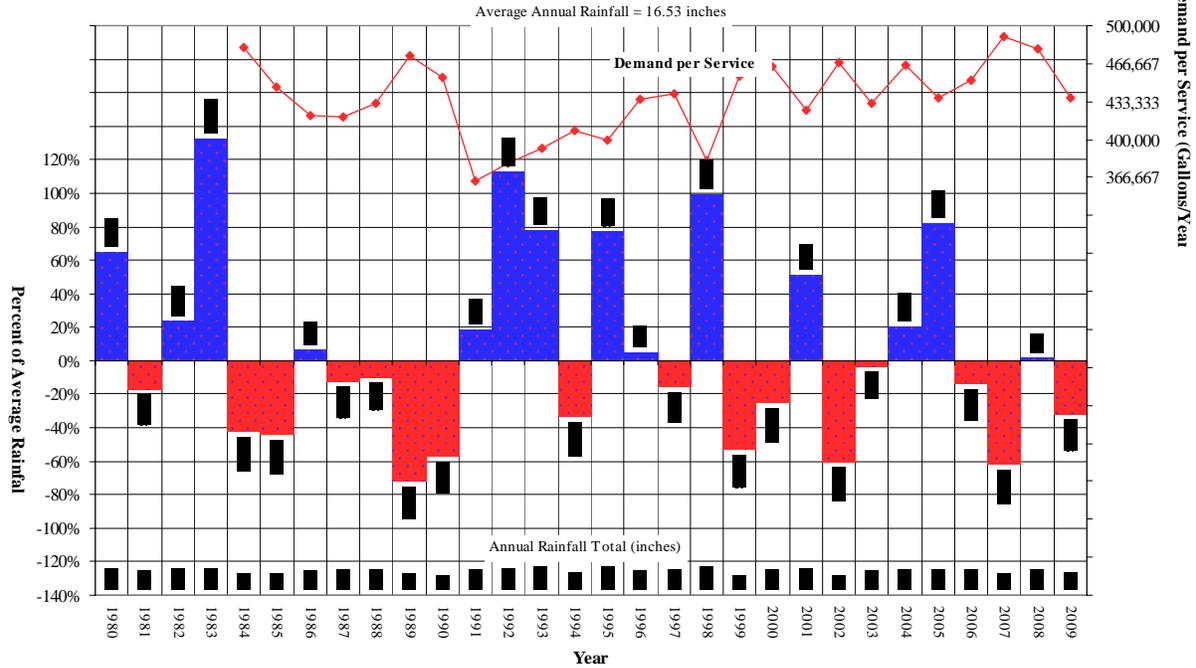

CMWD operates several facilities that increase the reliability of the CMWD's supply to its retailers. CMWD and MWD have banked a significant amount of water in the Las Posas groundwater basin. This water can be extracted during times when imported supplies are curtailed. In addition, Lake Bard is located in the center of the CMWD service area and can store approximately 8,000 ac-ft of water. CMWD operates the Lake Bard WTP, which is adjacent to the lake and has a treatment capacity of 100 cfs. Supplies stored in Lake Bard can be used during times when imported supplies are curtailed.

Additional future supplies are expected to come from treatment of local groundwater that is currently too saline for potable use. These desalters will improve overall regional supply reliability. Also, water transfer agreements between agricultural and municipal water users are another method for increasing supply reliability.

#### Annual Rainfall Variation

The annual variation in average rainfall and the average demand per service is shown in Figure 5.1-1. The average annual rainfall for the District is 16.9 inches. Since most of the water used in the Westlake District is imported from Northern California or from the Colorado River, annual precipitation in these areas determines the availability of imported water. However, local rainfall gives an indication of customer demand.. In general, water demand tends to increase in dry years primarily due to increased water use for activities such as landscape irrigation.

Figure 5.1-1: Comparison of Annual Rainfall to Historical Average

## 5.2 Drought Planning

For the purposes of this analysis 2003 was chosen as the most recent normal hydrologic year when rainfall was just 4 percent (15.9 in) below average. 2002 was chosen as the single dry year and had a rainfall of 61 percent (6.5 in) below average. The multiple dry year range used in this analysis was from 2006 to 2009, which coincides with the extended drought California experienced during this time.

Table 5.2-1: Basis of Water Year Data (Table 27)

Water Year Type	Base Year (s)
Average Water Year	2003
Single-Dry Water Year	2002
Multiple-Dry Water Years	2006-2009

Cal Water is not a regional water wholesaler and does not store water seasonally in reservoirs or other storage facilities. Therefore total runoff figures can not be used to determine supply reliability. Perhaps a better indication of annual variability would be the variation in customer demand between normal and single dry or multiple dry years. This can be seen in the overall average demand per service values for the District, as shown in Table 5.2-2. The data suggests a typical pattern where demand increases at the beginning of the drought and is gradually reduced as dry conditions persist. This reduction generally happens as a result of increased conservation requests by water providers and a general awareness of the problem by customers.

Table 5.2-2 shows the water supplies used in the normal, single dry, and multiple dry years described above. As a result of dry conditions and decreased storage, in 2008 MWD entered into Stage 2 of its Water Supply Allocation Plan, resulting in approximately 10 percent reduction in imported water allocations. Cal Water customers responded by reducing demand to meet these allocation targets. For the reasons described above, demand totals have been substituted for supply amounts in this analysis. If customers were not able to meet the reduction target, demand would increase, and penalty rates could be applied to these additional Cal Water purchases.

**Table 5.2-2: Supply Reliability – gal/service/yr (Table 28)**

Average / Normal Water Year	Single Dry Water Year	Multiple Dry Water Years			
		Year 1	Year 2	Year 3	Year 4
431,238	467,831	451,623	490,339	479,700	437,156
% of Normal	108%	105%	114%	111%	101%

The supply reliability analysis reflects the assertion that MWD’s available drought year supplies will be sufficient to provide the normal allotment of water to Cal Water’s Westlake District even in times of prolonged drought. For this analysis it is assumed that the current agreement for purchased water with CMWD will be renewed and that normal amounts of recycled water will be available in all years.

Table 5.2-3 shows an estimate of the minimum water supply for the next three years. In this case 2010 was assumed to be a normal year and the supply for 2011-2013 will be reduced by the percentages listed in Table 5.2-2 for the multiple dry years. Recycled water is a drought proof supply and will be available in their normal amounts in all years. Imported water will be used to make up the remaining supply and will vary according to customer demand.

Table 5.2-3: Supply Reliability – Current Water Sources - AFY (Table 31)				
Water Supply Source	Average / Normal Water Year Water Supply	Multiple Dry Water Year Water Supply		
		2011	2012	2013
Purchased	9,410	9,214	9,013	8,816
Recycled	419	419	420	420
Total	9,829	9,634	9,432	9,236
Percent of Normal Year	100%	98%	96%	94%

**5.2.1 Normal-Year Comparison**

Water supply and demand patterns change during normal, single dry, and multi dry years. To analyze these changes, Cal Water relies on historical usage to document expected changes in future usage in water demand; such as, assuming increasing demand due to increased irrigation needs or a decrease in demand due to awareness of drought conditions.

According to the Draft 2010 CMWD UWMP, there is a surplus of 12 percent in 2035. Therefore, Cal water expects all projected demands to be available in normal hydrologic years. For this analysis the normal supply is considered equal to the SBx7-7 target water demand projection. Conservation savings is already incorporated into this projection, therefore imported water and recycled water are the only supply sources. Table 5.2-4 indicates that the water supply will be reliable throughout the planning horizon of this UWMP and that no supply deficiencies are expected.

Table 5.2-4: Supply and Demand Comparison - Normal Year - AF (Table 32)						
	2015	2020	2025	2030	2035	2040
Purchased water	8,416	7,497	7,532	7,563	7,598	7,629
Recycled water	421	422	424	425	427	428
Supply totals	8,837	7,919	7,956	7,988	8,025	8,057
Demand totals	8,837	7,919	7,956	7,988	8,025	8,057
Difference	0	0	0	0	0	0
Difference as % of Supply	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Difference as % of Demand	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%

### 5.2.2 Single Dry-Year Comparison

In general, and from operational records, the District's demand has shown to increase during a single-dry years as compared to normal years. The water demand increases due to maintenance of landscape and other high water uses that would normally be supplied by precipitation. CMWD's single dry year analysis the Draft 2010 UWMP reflects this pattern. In a single dry year in 2035 CMWD expects a surplus of 8 percent. Therefore, Cal water expects all projected demands to be available in single dry hydrologic years.

The supply and demand values shown in Table 5.2-5 were calculated by increasing the target demand projection in each year by the percentage listed for the single dry year in Table 5.2-2.

	2015	2020	2025	2030	2035	2040
Purchased water	9,166	8,169	8,207	8,241	8,279	8,313
Recycled water	421	422	424	425	427	428
Supply totals	9,586	8,591	8,631	8,666	8,706	8,741
Demand totals	9,586	8,591	8,631	8,666	8,706	8,741
Difference	0	0	0	0	0	0
Difference as % of Supply	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%
Difference as % of Demand	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%

### 5.2.3 Multiple Dry-Year Comparison

As noted earlier, water demand generally increases early in a multiple dry year period then gradually decreases as the drought persists and customers respond to conservation messaging. This pattern is evident in Table 5.2-6 where demands at the beginning of each five year period are higher than in the normal year scenario, and demands decrease each year thereafter. The supplies and demands shown here are calculated by multiplying the target demand projection for that year by the percentages listed in Table 5.2-2 for the multiple dry year period.

According to the Draft 2010 CMWD UWMP, there will be a surplus of 5 percent even in multiple dry years through 2035. Again, no supply deficiency is expected during an extended drought. Therefore, Cal water expects all projected demands to be met in multiple dry years. However, as seen in the recent drought from 2007-2009, MWD will likely call for reductions in water use during these times and Cal Water will respond with increased conservation activities.

<b>Table 5.2-6: Supply And Demand Comparison - Multiple Dry Year Events – AFY (Table 34)</b>						
		<b>2015</b>	<b>2020</b>	<b>2025</b>	<b>2030</b>	<b>2035</b>
Multi-dry year first year supply	Purchased water	8,814	7,851	7,888	7,920	7,957
	Recycled water	421	422	424	425	427
	Supply Totals	9,234	8,273	8,312	8,346	8,384

	Difference as % of Demand	0.0%	0.0%	0.0%	0.0%	0.0%

### 5.3 Factors Affecting Reliability of Supply

Although the historical climatic record shows that the demand can be met by the supply, future climatic changes may present an obstacle. In addition, other factors which may threaten the reliability of the sole source are listed in Table 5.3-1.

Name of supply	Legal	Environmental	Water Quality	Climatic
CMWD	✓	✓	✓	✓

The reliability of MWD's imported water supply from the SWP has been seriously impacted by the recent Wanger Decision that limits pumping in the Delta. Pumping restrictions have been implemented, at least temporarily, because of the negative impact of pumping on Delta Smelt populations, which are protected under the California Endangered Species Act. The restrictions will be in place from late December through June and could reduce available supply from this source by up to 30 percent. This level of reduction will limit CMWD's ability to deliver normal allocation amounts to each of its retail customers, especially in dry or consecutive dry years. Delta pumping restrictions due to Delta Smelt and other emerging species of concern are expected to last for at least several years.

Before the Wanger Decision restrictions went into effect, short-term drought events were not thought to pose a serious threat to the reliability of supply in the Westlake District. The buffer of excess imported supplies will not exist as long as Delta pumping is reduced. This decreases the reliability of supply for the Westlake District. During drought events Cal Water may have to implement voluntary or mandatory rationing depending on the severity of the drought and availability of imported supplies. During extended droughts, as the primary source of supply shifts from CMWD deliveries to groundwater withdrawals, and the reliability of supply would decrease as the drought event continued.

### 5.4 Water Quality

The drinking water delivered in the Westlake District meets all federal and state regulations. All drinking water standards are set by the U.S. Environmental Protection Agency under the authorization of the Federal Safe Drinking Water Act of 1974. In California, the state's Department of Public Health can either adopt the USEPA standard or set state standards that are more stringent than those set by the federal government.

There are two types of drinking water standards: Primary and Secondary Standards. Primary Standards are designed to protect Public Health by establishing Maximum Contamination Levels (MCL) for substances in water that may be harmful to humans or affect their health. MCLs are established very conservatively for each contaminant, and

are generally based on health effects, which may occur if a person was to drink two liters of the water per day for 70 years. Secondary standards are based on the aesthetic qualities of the water, such as taste, odor, color, and certain mineral content. These standards, established by the State of California, specify limits for substances that may affect consumer acceptance of the water.

All the water for this district is treated surface water purchased from CMWD. There are generally no water quality issues except for seasonal nitrification in the reservoirs. Cal Water takes measures to mitigate this problem by turning over the water in the tanks. Occasionally, flushing may have to be performed and/or additional chlorine must be manually added to one or more of the storage tanks. There have been mixing systems installed in a few reservoirs for this purpose. Additional tank circulation systems may be necessary in the future. Since this water system is disinfected with chloramines, nitrification is a possibility that is constantly monitored in the distribution system and in storage tanks. No additional treatment is provided by Cal Water.

## **5.5 Water Shortage Contingency Plan**

This section contains an updated version of Cal Water's Water Shortage Contingency Plan. The Water Shortage Contingency Plan was last revised in response to the drought that California experienced between 1987 and 1992. The first version of the Plan was included in each subsequent UWMP update.

California's most recent drought event that began in the spring of 2006, coupled with the Delta pumping restrictions, brought increased awareness to the importance of drought preparedness. By the spring of 2008 it became apparent that several of Cal Water's service districts had the potential for water supply shortages and potential wholesaler allocations in the following year. In response, a Conservation/Supply Team was formed to develop a plan for addressing these potential issues. Through this process Cal Water learned valuable lessons and is better prepared for extended droughts or other long term water shortages. The results of this planning process are summarized in this Water Shortage Contingency Plan.

### **5.5.1 Water Shortage Contingency Plan Scope**

The Water Shortage Contingency Plan is a unique document designed to address specific conditions that may occur from time to time in Cal Water's service areas. It can be triggered by several types of events but is primarily used as a response to longer term drought conditions. The Water Shortage Contingency Plan provides a comprehensive company-wide strategy for approaching water supply shortages that may last from several months to several years in duration.

Other triggers may include a partial loss of supply due to a mechanical failure of either Cal Water or wholesale supplier facilities resulting from natural disasters, chemical contamination, or other water quality issues. These two types of triggers are unlikely in larger districts where operational changes can more easily be made in one part of the

system to overcome supply shortages in other parts of the system. However, in smaller isolated systems that rely heavily on one source of supply, a partial loss of this supply could necessitate the implementation of the Water Shortage Contingency Plan. Generally, this type of water supply shortage would not last as long as those caused by drought.

There are some important distinctions that should be made between the Water Shortage Contingency Plan and other programs and plans that Cal Water has for each district. Cal Water also maintains an Emergency Response Plan (ERP) for each service area. The ERP is similar to the Water Shortage Contingency Plan in that it may include a loss of supply and inability to serve our customers with normal quantities of water. However, the ERP is designed to manage crises that occur more suddenly and are caused by events such as natural disasters, technological failures, chemical contamination, or national security emergencies.

The ERP provides a guide for district and general office personnel to follow in response to one of these emergencies. It includes the policies, responsibilities, and procedures to be used to protect public safety and includes the setup of an Emergency Operations Center and implementation of the Standardized Emergency Management System. The ERP also describes the necessary inter-jurisdictional coordination and provides the communications and notification plan to insure an efficient response to the emergency.

The ERP for each district was completed in 2004 in response to the Public Health and Safety and Bioterrorism and Response Preparedness Act (H.R. 3448) of 2002. They were then updated in May of 2008. Cal Water is planning to rewrite the ERPs in the next few years. These new Plans will include more detailed district-specific information and will be designed to be used as a manual for Cal Water personnel during emergency situations.

Cal Water is also in the process of developing Water Conservation Master Plans for each district. These Water Conservation Master Plans are different from the Water Shortage Contingency Plans in that they are designed to permanently reduce per capita water use by Cal Water's customers. The Water Conservation Master Plans are not associated with any short or long term loss of supply but will have the effect of making existing supplies last further into the future. In the short term, this will also provide increased supply reliability.

The water use targets selected by Cal Water for each service area are consistent with current regulations. In general, this will mean a reduction in per capita demand. Specific reductions will vary by service area and are contained in the service-area specific Water Conservation Master Plans. The annual level of funding for these programs will be determined through each General Rate Case filed with the California Public Utilities Commission (CPUC). The Water Conservation Master Plan will be discussed in more detail in Section 5 of this UWMP.

### 5.5.2 Water Conservation/Drought Preparation Team

As mentioned earlier, Cal Water formed a Conservation/Supply Team in response to the water shortage conditions that were forecasted for 2009. This Team consisted of an interdepartmental group of personnel that guided the planning process for the company-wide response to the drought. Members of the Conservation/Supply Team include:

- Vice President of Regulatory and Corporate Communications
- Vice President of Customer Service, Human Resources, and Information Technology
- Director of Corporate Communications
- Director of Customer Service
- Conservation Manager
- Chief Engineer
- Water Resources Planning Supervisor
- Manager of Rates
- Manager of Operations
- Maintenance Manager
- Billing Manager
- Regulatory Accounting Manager
- Meter Operations Supervisor
- Support Staff

The Conservation/Supply Team held regular meetings to discuss strategies for all aspects of drought preparation such as water supply monitoring, public communications, wholesale and customer allocations, information technology improvements, and financial impacts. Additional staff participated as needed as the planning process progressed.

### 5.5.3 Water Supply Allocation Plan

During the most recent drought several of Cal Water's districts were faced with the possibility of reduced wholesale allocations of imported water. If implemented, Cal Water would need to reduce its use of this supply proportionally in order to meet regional conservation targets and avoid wholesaler imposed penalties for overuse. Cal Water would have to request customers to reduce water use, usually to the same level as required by the wholesaler.

These reductions could either be voluntary or mandatory depending on the severity of the cutback required. If mandatory rationing is deemed necessary, retail customer allocations would need to be implemented. To determine the methodology used for customer allocations a cross-functional Water Allocation Team was formed. The Water Allocation Team consisted of a subset of the Conservation/Supply Team and was tasked with developing the details of how the allocation process would be handled internally by Cal Water. The Water Allocation Team reported back to the Conservation/Supply Team at the regular meetings.

The Water Allocation Team meetings resulted in a comprehensive strategy that is summarized in Cal Water's Water Supply Allocation Plan. The Water Supply Allocation Plan details the methodology used for determining customer allocations, conducting public communications, tracking water use, assessing penalties, and processing appeals.

The Water Supply Allocation Plan also outlines regulatory actions that must be taken in order to implement mandatory allocations. If it is determined that mandatory allocations are likely to be necessary in a particular district Cal Water will file a Tier 2 advice letter with the CPUC that describes the need for mandatory allocations as well as our methodology and plan for implementation. A public hearing is required during the 30 days following this filing and all customers in the affected district will be notified of the hearing. If, after the 30 day period, it is determined that mandatory allocations are necessary, Cal Water will file a Tier 1 advice letter with the CPUC, which would make mandatory allocations effective 5 days following the filing.

Cal Water has the legal authority to implement mandatory allocations only after requesting from the CPUC that Tariff Rule 14.1, Mandatory Conservation Plan, be added to existing tariffs. *Section A. Conservation – Nonessential or Unauthorized Water Use* of Tariff Rule 14.1 identifies specific water use prohibitions. Prior to implementing mandatory allocations Cal Water will communicate details of the Plan to all customers.

#### **5.5.4 Allocation Methodology and Customer Information**

The Water Allocation Team's methodology for determining customer allocations was decided through careful consideration of all available information. Throughout this process the Team tried to maintain fairness to all customers and develop a plan that was easy to understand and communicate. Secondary concerns included impacts to Cal Water such as the ease of implementation and revenue shortfalls.

Customer allocations will be calculated on a monthly basis for each "premise", or customer location. The required cutback will be a percent reduction from prior use compared to baseline time period. The percentage reduction and baseline that Cal Water uses will be consistent with those used by the regional wholesaler. This will be done to ensure regional coordination between agencies and to offer a clear message to the public. In districts that do not have an imported supply and therefore no wholesaler, Cal Water will choose the percent reduction depending on the severity of the water shortage.

In most cases the percent reduction will be kept constant on an annual basis. It will be reviewed and adjusted as necessary in the spring of each year after the water supply picture becomes clear for the following dry season. In most districts Cal Water does not have direct control over long term storage of imported water and will rely on the California Department of Water Resources, U.S. Bureau of Reclamation, and regional water wholesalers to manage carryover storage between years. In some cases it may be necessary to adjust these percentages mid-year, if, for example, a district is not meeting its reduction target. The allocation period will end when Cal Water determines that the water shortage no longer exists and ample supplies are available on an ongoing basis.

A minimum allocation will be given to single-family residential customers whose monthly allocation would fall below a level that is considered necessary for health and safety. These minimum allocations will be calculated for each district and will include water for indoor consumption on a per capita basis and also a percentage of normal water for outdoor use such as landscape irrigation. Multi-family, commercial, industrial, government, and other service connection categories will not be subject to minimum allocations.

Cal Water will provide customers the opportunity to bank unused water that has been allocated in a billing period. A customer will bank their unused allocation in a given billing period which can then be used to offset a future month where the customer exceeds their allocation. There is no limit to the amount of water that can be banked by a customer. All banked water will expire once allocations are determined to no longer be needed.

As a deterrent to exceeding monthly allocations and to offset penalties that Cal Water may incur from wholesale agencies, a penalty rate will be applied to a customer's water use that is in excess of their allocation. This penalty rate will be charged in addition to the normal tiered rate for every unit (Ccf) above the allocation during a billing period.

If a customer feels that their allocation does not represent their current need, or to dispute penalties assessed to their account, customers can file an appeal with their local district. The appropriate personnel will review the appeal and issue a judgment in writing. The appeals will be reviewed according to rules outlined in the Water Supply Allocation Plan.

During a water shortage priority will be given to uses that promote public health and safety. These uses include residential indoor use and other sanitary purposes. On a case by case basis Cal Water will decide that certain services are seen as essential, such as hospitals, and may exempt the customer from allocations. The second priority will be given to commercial and industrial water use in an effort to minimize financial impacts to local businesses. And finally, outdoor irrigation has the lowest priority.

If Cal Water requests voluntary reductions, all customer categories will be asked to make the same percent reduction. If mandatory reductions are required, which in general means a reduction of greater than 15 percent, Cal Water may develop different demand reduction targets for each connection category. This will be done to enforce the priorities listed above and to ensure that the correct mix of targets are chosen so that the overall district demand reduction goal is reached.

### **5.5.5 Drought Stages**

Cal Water has developed a four stage approach to drought response that corresponds to specific levels of water supply shortage. At each higher stage Cal Water will become more aggressive in requiring water use reductions from its customers. The decision to enter a new stage will be made by careful consideration of a variety of factors including

wholesale supply, availability of alternative supplies, time of year, and regional coordinated activities. These stages are designed to guide Cal Water personnel in making informed decisions during water shortages. A certain amount of flexibility is built in to the stages to allow for the unique characteristics of each water shortage event and the unique characteristics within each of Cal Water's districts. In each progressive stage the actions taken in earlier stages will be carried through to the next stage either at the same or at an increased intensity level, thereby becoming more restrictive.

When the water conditions in a district appear to warrant the activation of the Shortage Contingency Plan's Demand Reduction Stages, whether that be via implementing Stage 1, the movement from one Stage to a higher stage, the movement from a higher stage back down to a lower stage, or deactivating the use of Demand Reduction Stages altogether; the Water Conservation /Water Supply Team will consider those conditions at hand and prepare a recommendation on the appropriate action to be taken by the Company. The Team's recommendation will be presented by the Chief Engineer to the Vice President of Engineering and Water Quality. If the Vice President of Engineering and Water Quality concurs with the WC/WS Team recommendation, then he or she will take that recommendation to the President and Chief Executive Officer. The President & CEO will make the final determination as to whether or not the recommended action is to be taken by the Company.

If it is determined that the Company will implement or change the active Demand Reduction Stage for a given District, then a press release will be made in a manner that advises the customers served by that district of this determination. This press release will explain the desired outcome of the action to implement the appropriate stage. Upon making that determination Cal Water will immediately begin implementing the specific actions identified for the determined stage as outlined in the remainder of this section of the Shortage Contingency plan.

Stage 1 covers water shortages of up to 10 percent and can be used to address annual variations in precipitation and mild drought events that may last only a year or two. All reductions in Stage 1 are voluntary and impacts to customers are minimal. The actions to be taken by Cal Water in Stage 1 are listed in Table 5.5-1.

Table 5.5-1: Demand Reduction Stage 1 (Table 36)	
Stage	Water Supplier Actions
<p><b>1. Minimal</b></p> <p>5 to 10 percent Shortage</p> <p>Up to 10 percent Reduction Goal</p> <p>Voluntary Reductions</p>	<p><b>Cal Water will:</b></p> <p>Request voluntary customer conservation as described in CPUC Rule 14.1.</p> <p>Maintain an ongoing public information campaign.</p> <p>Maintain conservation kit distribution programs.</p> <p>Maintain school education programs.</p> <p>Maintain incentive programs for high efficiency devices.</p> <p>Coordinate drought response with wholesale suppliers and cities.</p> <p>Lobby cities for passage of drought ordinances.</p> <p>Discontinue system flushing except for water quality purposes.</p> <p>Request that restaurants serve water only on request.</p>

Stage 2 includes water shortages of between 10 and 20 percent. Stage 2 will be entered during prolonged water shortages of moderate severity such as those caused by a multi-year drought. Reduction methods can either be voluntary or mandatory depending on the severity of the water shortage. Allocations would likely be implemented when the shortage exceeds 15 percent. Customers will begin to notice moderate impacts to normal water use and companies may begin to have financial impacts. In Stage 2 Cal Water will intensify its conservation efforts by implementing the actions listed in Table 5.5-2. All actions from Stage 1 will be carried through or intensified in Stage 2.

Table 5.5-2: Demand Reduction Stage 2 (Table 36)	
Stage	Water Supplier Actions
<p><b>2. Moderate</b></p> <p>10 to 20 Percent Shortage</p> <p>Up to 20 Percent Reduction Goal</p> <p>Voluntary or Mandatory Reductions</p>	<p><b>Cal Water will:</b></p> <p>Increase or continue all actions from Stage 1.</p> <p>Implement communication plan with customers, cities, and wholesale suppliers.</p> <p>Request voluntary or mandatory customer reductions.</p> <p>File Schedule 14.1 with CPUC approval if necessary.</p> <p>Request memorandum account to track penalty rate proceeds and other drought related expenses.</p> <p>Lobby for implementation of drought ordinances.</p> <p>Monitor water use for compliance with reduction targets.</p>

Stage 3 represents a severe water shortage emergency with a reduction in supply of between 20 and 35 percent. This stage can be triggered by the most severe multi-year droughts, major failures in water production and distribution facilities, or by water quality concerns, especially in smaller isolated systems. A shortage of this magnitude may begin to seriously impact public health and safety, and cause significant financial hardships on local businesses. All reductions will be mandatory and customer allocations would be necessary. During Stage 3 Cal Water will take the following actions listed in Table 5.5-3, which includes all the actions from Stage 2.

Table 5.5-3: Demand Reduction Stage 3 (Table 36)	
Stage	Water Supplier Actions
<p><b>3. Severe</b></p> <p>20 to 35 Percent Shortage</p> <p>Up to 35 Percent Reduction Goal</p> <p>Mandatory Reductions</p>	<p><b>Cal Water will:</b></p> <p>Increase or continue all actions from previous stages.</p> <p>Implement mandatory conservation with CPUC approval.</p> <p>Install flow restrictors on repeat offenders.</p> <p>Require customers to have high efficiency devices before granting increased allocations.</p> <p>Require participation in survey before granting an increased allocation.</p>

Stage 4 is a critical water shortage emergency with a reduction of supply of at least 35 and potentially above 50 percent. This represents an exceptional crisis that could be caused only by the most severe multi-year drought, natural disaster, or catastrophic failure of major water supply infrastructure. Impacts to public health and safety would be significant. In Stage 4 Cal Water will take the additional actions listed in Table 5.5-4 while also continuing or increasing actions from Stage 3.

Table 5.5-4: Demand Reduction Stage 4 (Table 36)	
Stage	Water Supplier Actions
<p><b>4. Critical</b></p> <p>35 to 50+ Percent Shortage</p> <p>Up to and above a 50 percent Reduction Goal</p> <p>Mandatory Reductions</p>	<p><b>Cal Water will:</b></p> <p>Increase or continue all actions from previous stages.</p> <p>Discontinue service for repeat offenders.</p> <p>Monitor water use weekly for compliance with reduction targets.</p> <p>Prohibit potable water use for landscape irrigation.</p>

**5.5.6 Water Supply Conditions and Trigger Levels**

As described in Section 4, the water supply for the Westlake District is a mix of imported water and recycled water. The recycled supply comes through CMWD. The Westlake District began serving recycled water to its customers in 1995 and now delivers approximately 400 AFY. Recycled water offers a drought proof supply that is available in all years and would not be subject to allocations from CMWD. During a water shortage Cal Water can make an effort to maximize recycled water deliveries to replace potable water demand.

Cal Water’s imported supply for the Westlake District also comes through CMWD, which is a member agency of the Metropolitan Water District of Southern California (MWD). Cal Water’s Water Shortage Allocation Plan will ultimately be triggered by actions within these agencies. Cal Water will follow the lead of these agencies when deciding whether to implement the Water Shortage Allocation Plan. The percent shortage identified by MWD will determine which drought stage Cal Water enters into. These thresholds are shown in Table 5.5-5.

Stage	Percent Shortage
Stage 1	5 to 10% supply reduction
Stage 2	10 to 20% supply reduction
Stage 3	20 to 35% supply reduction
Stage 4	35 to 50% supply reduction

In April of each year, after the winter storm season, MWD will assess its available water supply and decide if it will request voluntary or mandatory reductions by its member agencies. MWD will judge the performance of CMWD retailers as a whole and will only assess penalties to CMWD if the retailers' collective use exceeds its allocation. These reduction targets will be passed along through CMWD to Cal Water and from Cal Water to our customers. If necessary, the allocation period will begin on July 1<sup>st</sup> of the given year and will continue at least one year or until the availability of supplies warrants the lifting of water use restrictions.

Cal Water's timeline for implementing its Water Shortage Contingency Plan will generally follow MWD's schedule. However, Cal Water will monitor water supply conditions throughout the year and will independently assess the threat of water shortage conditions. This will allow Cal Water to make the necessary preparations prior to the high water use season when restrictions would likely go into effect. Preparations may include filing the appropriate advice letters with the CPUC, hiring additional staff, training existing staff, making billing system improvements, developing public communications material, making operational changes, and performing maintenance to the water system facilities. This advanced planning will minimize the potential lag time between when a water shortage is declared and when restrictions can take effect. The reduction in lag time is essential in order to maximize the water savings during the high use summer months.

In 1999, MWD developed a Water Surplus and Drought Management Plan (WSDM Plan) that included guidelines for implementing water supply restrictions in the event of a water shortage. The WSDM Plan does not outline specific criteria for how water would be distributed among the MWD member agencies during water shortage conditions, but states that the methods to be used for determining reduction in supplies to each member agency would be developed in a manner that was equitable and minimized hardship to retail water customers. In 2007, MWD began to update their plans for addressing water shortage conditions. The impetus for this was a combination of on-going dry conditions and reduced deliveries from the SWP. In February 2008, the MWD Board adopted the Water Supply Allocation Plan. This plan is an extension of the WSDM Plan and includes specific formula for allocating available supplies among MWD member agencies.

### **5.5.7 Water Use Restriction Enforcement**

Because of its investor owned status Cal Water has limited authority to enforce water use restrictions unless Rule 14.1 is enacted through CPUC approval. Restrictions on water use prior to enacting Rule 14.1 must be regulated by ordinances passed by the local governments in each community served. Cal Water has worked with municipalities to pass ordinances and will continue this effort on an ongoing basis. Rule 14.1 contains a detailed list of the water use restrictions common to many of these ordinances, and is included as Appendix E of this UWMP.

Cal Water maintains extensive water use records on individual metered customer accounts. These records are reviewed in the districts to identify potential water loss problems. In order to protect itself against serious and unnecessary waste or misuse of water, Cal Water may meter any flat rate service and apply the regularly established meter rates where the customer continues to misuse or waste water beyond five days after Cal Water has given the customer written notice to remedy such practices.

During all stages of water shortages, production figures are reported to and monitored by the district manager. Consumption will be monitored through these daily production figures in the district for compliance with necessary reductions.

Cal Water, after one written warning, shall install a flow-restricting device on the service line of any customer observed by Cal Water personnel to be using water for any non-essential or unauthorized use defined in Section A. of Tariff Rule 14.1. Repeated violations of unauthorized water use will result in discontinuance of water service.

### **5.5.8 Analysis of Revenue and Expenditure Impacts**

Cal Water is an investor-owned water utility and, as such, is regulated by the CPUC. On March 8, 1989, the Commission instituted an investigation to determine what actions should be taken to mitigate the effects of water shortages on the State's regulated utilities and their customers. In decision D. 90-07-067, effective July 18, 1990, the Commission authorized all utilities to establish memorandum accounts to track expenses and revenue shortfalls caused both by mandatory rationing and by voluntary conservation efforts. Subsequently, D. 90-08-55 required each class A utility (more than 10,000 connections) seeking to recover revenues from a drought memorandum account to submit; for Commission approval, a water management program that addresses long-term strategies for reducing water consumption. Utilities with approved water management programs were authorized to implement a surcharge to recover revenue shortfalls recorded in their drought memorandum accounts.

---

However, the Commission's Decision 94-02-043 dated February 16, 1994, states:

*10. Now that the drought is over, there is no need to track losses in sales due to residual conservation.*

*11. The procedures governing voluntary conservation memorandum accounts (see D.92-09-084) developed in this Drought Investigation will no longer be available to water companies as of the date of this order.*

*12. Procedures and remedies developed in the Drought Investigation that are not specifically authorized for use in the event of future drought in these Ordering Paragraphs will no longer be available to water companies as of the date of this order except upon filing and approval of a formal application.*

*(CPUC Decision 94-02-043, Findings of Fact, paragraphs 10-12)*

In 2008 the CPUC allowed for the creation of a Water Revenue Adjustment Mechanism (WRAM) and Modified Cost Balancing Accounts (MCBA). The goals of the WRAM and MCBA are to sever the relationship between sales and revenue to remove the disincentive to implement conservation rates and conservation programs especially in times of drought. WRAM and MCBA are designed to ensure that the utilities and ratepayers are proportionally affected when conservation rates are implemented, so that neither party is harmed nor benefits. Because of these regulatory developments Cal Water expects to increase the implementation of conservation rates and conservation programs on a permanent basis.

During water supply shortages Cal Water would expect to see a reduction in revenue. The amount of this reduction would depend on the total amount of water being conserved and the price (tier rate) at which the cutbacks were made for each customer. In other words, the reduction would be roughly equivalent to the quantity charge for the amount of water saved. Cal Water would still receive its monthly service charge fees.

Cal Water has adequate reserves to overcome this short term reduction. These reductions in revenue would also be recovered through the WRAM and MCBA. Through the WRAM and MCBA Cal Water will be able to track its revenue impacts and expenditures during water shortages and recover these losses through the CPUC rate case process in future years. Because of these new mechanisms Cal Water is assured that it will have adequate reserves available to operate normally under water shortage conditions.

Expenditures will not increase due to a mild water shortage condition. Any expenditure made during this time will come out of the normal conservation budget that has been approved by the CPUC. Actions that may be taken include public information campaigns that draw attention to the shortage and steer customers towards our other conservation programs (toilet rebates, washing machine rebates, home audits, etc) that are available. These programs will be paid for by money that is already budgeted. Therefore no additional expenditures will take place. If the water shortage warrants mandatory allocations, Cal Water would need to file an advice letter with the CPUC to seek approval to implement mandatory allocations. This process would include securing any additional

funding necessary for the administration of this program. Again, these costs would be recovered through the MCBA and WRAM.

### **5.5.9 Catastrophic Water Supply Interruption**

As mentioned earlier, Cal Water has an ERP in place that coordinates the overall company response to a disaster in any or all of its districts. In addition, the ERP requires each District to have a local disaster plan that coordinates emergency responses with other agencies in the area.

Cal Water also inspects its facilities annually for earthquake safety. To prevent loss of these facilities during an earthquake, auxiliary generators and improvements to the water storage facilities have been installed as part of Cal Water's annual budgeting and improvement process.

During an emergency, the District can transfer water through interconnections to or from the neighboring water system owned by the Las Virgenes Water District. These interconnections can be used to help offset the impact of interrupted service to District customers or, being two-way connections, these facilities can be used to supply water to Las Virgenes.

---

## 6 Demand Management Measures

---

### 6.1 Statewide Urban Water Demand Reduction Policies

As mentioned earlier, Cal Water is in the process of significantly expanding its conservation programs. Inter-related state-level policies and agreements aimed at reducing urban water use have provided much of the impetus for this change. The policies include: (1) recent decisions by the California Public Utilities Commission (CPUC) directing Class A and B water utilities to reduce per capita urban water demand; (2) state legislation mandating urban water suppliers to reduce per capita demand 20 percent by 2020; and (3) the Memorandum of Understanding Regarding Urban Water Conservation in California (MOU). This section discusses these requirements, their relationship to one another, and their relationship to Cal Water's overall conservation strategy.

The CPUC's Decision 07-05-062 directed Class A and B water utilities to submit a plan to achieve a 5 percent reduction in average customer water use over each three-year rate cycle. This policy was refined under Decision 08-02-036, which established a water use reduction goal of 3 to 6 percent in per customer or service connection consumption every three years once a full conservation program, with price and non-price components, is in place. These decisions anticipated enactment of policies by the State legislature to reduce urban water use in California 20 percent by 2020.

SBx7-7 requires the state to achieve a 20 percent reduction in urban per capita water use by December 31, 2020. The state is required to make incremental progress toward this goal by reducing per capita water use by at least 10 percent on or before December 31, 2015. SBx7-7 requires each urban retail water supplier to develop interim and 2020 urban water use targets. Urban retail water suppliers will not be eligible for state water grants or loans unless they comply with SBx7-7's requirements.

There are three ways in which a water supplier can comply with the MOU. The first way is to implement a set of water conservation best management practices (BMPs) according to the requirements and schedules set forth in Exhibit 1 of the MOU. The second way, called Flex Track compliance, is to implement conservation programs expected to save an equivalent or greater volume of water than the BMPs. The third way, similar to SBx7-7, is to reduce per capita water use. Each of these compliance options is briefly described below.

Originally, the MOU established a set of BMPs that signatories agreed to implement in good faith. For each BMP, the MOU established the actions required by the water supplier (e.g. site surveys, fixture and appliance rebates, water use budgets, volumetric pricing and conservation rate designs), the implementation schedule, and the required level of effort (in the MOU this is referred to as the coverage requirement). Additionally, the MOU established the terms by which a water supplier could opt out of implementing a BMP.

BMPs are grouped into five categories. Two categories, Utility Operations and Education, are “Foundational BMPs” because they are considered to be essential water conservation activities by any utility and are adopted for implementation by all signatories to the MOU as ongoing practices with no time limits. The remaining BMPs are “Programmatic BMPs” and are organized into Residential, Commercial, Industrial, and Institutional (CII), and Landscape categories. Table 6.1-1 shows the BMPs by category. The requirements and coverage levels of each BMP are set forth in Exhibit 1 of the MOU. As of the date of this UWMP, Cal Water is in process of completing and submitting BMP reports to the CUWCC for the period 2009-2010. Submission was delayed due to delays in the CUWCC reporting forms being made available.

<b>Table 6.1-1: MOU Best Management Practices</b>	
<b>BMP Group</b>	<b>BMP Name</b>
1. Utility Operations Programs (F)	Conservation Coordinator
	Water Waste Prevention
	Wholesale Agency Assistance Programs
	Water Loss Control
	Metering & Volumetric Rates
	Retail Conservation Pricing
2. Education Programs (F)	Public Information Programs
	School Education Programs
3. Residential (P)	Residential Assistance Program
	Landscape Water Surveys
	High Efficiency Clothes Washer Program
	Watersense Toilet Program
	Watersense Specifications for Residential Development
4. Commercial, Industrial, Institutional (P)	Reduce baseline CII water use by 10% in 10 years
5. Landscape (P)	Large Landscape Water Budget Programs
	Large Landscape Water Surveys
F = Foundational BMP, P = Programmatic BMP	

Under Flex Track, a water supplier can estimate the expected water savings over the 10-year period 2009-2018 if it were to implement the programmatic BMPs in accordance with the MOU’s schedule, coverage, and exemption requirements, and then achieve these water savings through any combination of programs it desires. Thus, through the Flex Track compliance option, a water supplier agrees to save a certain volume of water using whatever it determines to be the best combination of programs. Because the savings target depends on the programmatic BMP coverage requirements, which in turn are functions of service area size and composition of demand, the volume of water to be saved under this compliance option must be calculated separately for each supplier. The methodologies and tools for water suppliers to implement these calculations are still being developed by the CUWCC.

Under the gpcd option, a water supplier can comply with the MOU by reducing its baseline gpcd by 18 percent by 2018. The baseline is the ten-year period 1997-2006. The MOU also establishes interim gpcd targets and the highest acceptable levels of water use deemed to be in compliance with this option. The MOU's gpcd option is similar to using Method 1 to set the SBx7-7 target, except that it uses a fixed baseline period and only runs through 2018. This compliance option may be difficult to achieve for Cal Water districts that are part of a regional alliance for purposes of SBx7-7 compliance because savings as a percent of demand will vary considerably among the districts in the alliance. It may also conflict with district-specific SBx7-7 targets set using method 3 (hydrologic region-based target). Because of these potential conflicts, this is not considered a viable MOU compliance option for Cal Water districts.

Cal Water plans to use Flex Track to comply with the MOU. This compliance option affords the most flexibility in selecting conservation programs suited to each Cal Water district and allows for more streamlined reporting. Because CUWCC tools for calculating a district's Flex Track savings target are not yet available, Cal Water developed its own target estimates for planning purposes. Cal Water will update these estimates as necessary following the release of the CUWCC Flex Track target calculator.

## 6.2 Conservation Master Plans

In an effort to address the statewide policies for urban water use reduction Cal Water developed Conservation Master Plans for each of its service districts. These Conservation Master Plans are designed to provide a framework for meeting these statewide policies and to chart a course for Cal Water's conservation programs over the next five years. The major tasks of the Conservation Master Plans include:

1. A complete review of State policies and development of a compliance strategy
2. Calculating all appropriate per capita targets
3. Determining water savings required from new programs
4. Performing an analysis of conservation programs
5. Developing a portfolio of conservation programs
6. Creating a plan for monitoring and update of Conservation Master Plans

Cal Water's Conservation Master Plans have a five year planning horizon and are designed to be updated in coordination with the UWMP for each district. The Conservation Master Plan for the Westlake District is included in its entirety as Appendix G. A discussion of baseline and target water use can be found in Section 3 of this UWMP. A summary of the water savings requirements and program portfolio is summarized in the following section.

### 6.3 Water Savings Requirements

The gross water savings required under SBx7-7 can be determined with a simple calculation by subtracting the target water demand from the unadjusted baseline demand. According to this calculation the Westlake District has a gross savings requirement of 1,056 AF from 2011-2015, as shown in Table 6.3-1.

<b>Gross Water Savings Required by 2015</b>	<b>SBx7-7</b>	<b>MOU Flex Track</b>
2015 Unadjusted Baseline Demand	9,455 AF	9,455 AF
2015 Target Demand	8,399 AF	9,281 AF
<b>Gross Savings Requirement</b>	<b>1,056 AF</b>	<b>174 AF</b>

As discussed earlier, because CUWCC tools for calculating a district's Flex Track savings target are not yet available, Cal Water developed its own target estimates for planning purposes. The targets are based on the expected water savings from cost-effective programmatic BMPs over the ten-year period 2009-2018. The coverage requirements for the programmatic BMPs were used to calculate the Flex Track targets. Expected water savings and cost-effectiveness were based on the conservation program specifications and avoided water supply costs. The supporting data and calculations are provided in Appendix G.

The differences between the unadjusted baseline demand, district-specific SBx7-7 target, and MOU Flex Track target are shown in Table 6.3-1. This shows the maximum amount of water savings needed for SBx7-7 compliance, as well as the savings required for MOU compliance. Because Westlake District is part of a regional alliance, the amount of water savings needed for SBx7-7 compliance may turn out to be less than the amount shown in the table. Also, some of the reduction in baseline demand needed to achieve SBx7-7 and MOU compliance will come from efficiency codes, response to adjustments in rates, and savings from past program implementation. The remainder will need to come from new conservation program activity.

The unadjusted baseline demand described in Section 3 does not account for future changes in water demand due to the effects of plumbing fixture efficiency codes, changes in water rates, metering, and existing conservation programs. A portion of the gross savings requirements shown above are expected to come from these sources. The Conservation Master Plan includes an estimate of the volume of water saved as a result of these things. The results are used to adjust baseline demand so that the volume of water savings that will need to come from new conservation programs can be determined.

Two recent California laws are expected to accelerate the replacement of low efficiency plumbing fixtures – primarily toilets and showerheads – with higher efficiency alternatives.

- AB 715, passed in 2007, amended the California Building and Safety Code to require by January 1, 2014, that toilets sold or installed in California use no more than 1.28 gallons per flush. It also requires that urinals sold or installed use no more than 0.5 gallons per flush.
- SB 407, passed in 2009, amended the California Civil Code to require replacement of low efficiency plumbing fixtures with higher efficiency alternatives when a property undergoes alterations, improvements, or transfer. In the case of single-family residential properties, issuance of a certificate of final completion and occupancy or final permit approval by the local building department for building alterations or improvements will be conditional on the replacement of low efficiency plumbing fixtures beginning in 2014. Single-family property owners are required by law to replace any remaining non-compliant plumbing fixtures by no later than January 1, 2017. After this date, a seller or transferor of single-family residential real property must disclose in writing to the prospective purchaser or transferee whether the property includes any noncompliant plumbing fixtures. For multi-family and commercial properties non-compliant fixtures must be replaced by January 1, 2019. As with single-family properties, final permits or approvals for alterations or improvements are conditional on the replacement of low efficiency fixtures beginning in 2014.

The phase-in dates for AB 715 and SB 407 mean they will not greatly contribute to meeting the 2015 interim gpcd target under SBx7-7. But they will support meeting the 2020 target. Moreover, since the early 1990's, the sale and installation of toilets manufactured to flush more than 1.6 gallons, showerheads manufactured to have a flow capacity more than 2.5 gallons per minute, and interior faucets manufactured to emit more than 2.2 gallons per minute has been prohibited. These requirements will continue to improve the efficiency of plumbing fixtures in older residential and commercial buildings.

Water savings from expected rate adjustments in Westlake District were also calculated. The estimates are based on inflation-adjusted changes in rates for 2011, 2012, and 2013, as contained in CPUC's proposed GRC decision. Short-run price elasticity estimates used to calculate potential changes in demand were drawn from the CUWCC's conservation rate guidebook.

In addition to savings from codes and rates, conservation activity occurring in 2009 and 2010 were also taken into account. The adjusted baseline demand and savings associated with code changes, rate changes, and existing conservation programs are shown in Table 6.3-2.

<b>Adjusted Baseline (AF)</b>	<b>2011</b>	<b>2012</b>	<b>2013</b>	<b>2014</b>	<b>2015</b>
Unadjusted Baseline	9,422	9,433	9,438	9,444	9,455
Less Savings from					
Codes	9	15	22	28	36
Schedule Rate Increases	-15	-40	-76	-96	-140
Existing Programs	20	20	19	15	11
<b>Adjusted Baseline Demand</b>	<b>9,409</b>	<b>9,438</b>	<b>9,473</b>	<b>9,497</b>	<b>9,548</b>
Per Capita (GPCD)	497	498	500	500	503

The amount of water savings required from new conservation programs is not the same for SBx7-7 and MOU Flex Track compliance. In the case of SBx7-7, the objective is to reduce 2015 per capita water use at least to the target of 442 gpcd, and any expected savings from codes, rates, and existing conservation programs can be credited toward meeting this goal. This is not the case for MOU Flex Track compliance, where the objective is to implement conservation programs that would save at least as much as the Flex Track target. Unlike SBx7-7, water savings from codes and rates cannot be credited against the Flex Track target. Only savings from existing conservation programs can be deducted.

Savings required from new conservation programs to meet SBx7-7 and MOU Flex Track compliance requirements are summarized in Table 6.3-3. In the case of SBx7-7, 2015 potable demand, after accounting for codes, scheduled changes in rates, and 2009-10 conservation program activity, is projected to exceed the SBx7-7 compliance target by 1,149 AF. In the case of MOU Flex Track Compliance, water savings from conservation programs implemented in 2009 and 2010 are expected to generate about 11 AF of savings in 2015. Thus conservation programs implemented over the period 2011-2015 will need to save an additional 163 AF by 2015 for West Lake District to be in compliance with the MOU.

<b>2015 Net Savings Requirement (AF)</b>	<b>SBx7-7</b>	<b>MOU Flex Track</b>
<b>Gross Savings Requirement</b>	<b>1,056</b>	<b>174</b>
Less		
Savings from codes	36	NA
Savings from rates	-140	NA
Savings from existing programs	<u>11</u>	<u>11</u>
<i>Subtotal Expected Savings</i>	<i>-93</i>	<i>11</i>
<b>Savings Required from New Programs<sup>1</sup></b>	<b>1,149</b>	<b>163</b>

<sup>1</sup>Negative net savings indicates that no new program savings required for compliance

## 6.4 Conservation Program Analysis

Cal Water engaged in a detailed, multi-step process to identify the best mix of programs to achieve the required savings. The process began with an inclusive range of potential program concepts. These concepts were qualitatively analyzed to eliminate those that were clearly inappropriate for each district and thereby narrow the analytical focus to those remaining programs that were potentially appropriate. Those programs were then subjected to detailed quantitative analysis. This Section describes the steps of the analytical process for Westlake District, and the programs that emerged as potential components of a portfolio of programs for the District.

As a result of an exhaustive search of the literature, consultation with experts in the field, knowledge of conservation programming by other water suppliers, and the experience of the project team, a total of more than 75 conservation program concepts were defined. At this point in the process, the goal was to be as inclusive as possible. The list was therefore intentionally large to ensure that all possible program concepts were considered. Cal Water did not want to risk inadvertently excluding a program from consideration.

Once the range of program concepts was defined, the next step was to subject each program concept to a careful district-specific qualitative screen, the objective of which was to eliminate those program concepts that were clearly inappropriate.

A preliminary quantitative analysis was conducted on the programs that passed the qualitative screen. To do that, estimates were made of key savings and cost parameters for each of the programs. Where applicable, these estimates were based on prior Cal Water experience with similar programs. In the absence of such experience, the experience of other water suppliers, the expertise of the project team, consultation with national experts, and published figures, where available, were relied upon. In particular, estimates developed by the California Urban Water Conservation Council and the Alliance for Water Efficiency were utilized where such estimates were available. While in most cases, the savings assumptions for a program do not vary across districts, for several programs, they do due to district-specific characteristics of household size, climate, etc. Other than meter installation, program cost assumptions are uniform across districts, although in some cases, cost sharing with other water utilities reduce Cal Water's share.

Using the results of the qualitative screening and preliminary quantitative analysis, Cal Water identified five core programs that it would run in every district over the next five years. In addition to the core programs, an additional set of non-core programs was selected. Unlike core programs, Cal Water may not offer non-core programs in every district or in every year. Implementation of non-core programs will depend on whether additional water savings are required for SBx7-7 compliance, MOU compliance, or to help address local supply constraints. Table 6.4-1 lists all Cal Water core and non-core conservation programs.

Table 6.4-1: Cal Water Conservation Programs

Program Name	Description	Target Market
<b>CORE PROGRAMS</b>		
Rebate/Vouchers for toilets, urinals, and clothes washers	Provide customer rebates for high-efficiency toilets, urinals, and clothes washers	All customer segments
Residential Surveys	Provide residential surveys to low-income customers, high-bill customers, and upon customer request or as pre-screen for participation in direct install programs	All residential market segments
Residential Showerhead/Water Conservation Kit Distribution	Provide residential showerhead/water conservation kits to customers upon request, as part of residential surveys, and as part of school education curriculum	All residential market segments
Pop-Up Nozzle Irrigation System Distribution	Offer high-efficiency pop-up irrigation nozzles through customer vouchers or direct install.	All customer segments
Public Information/Education	Provide conservation messaging via radio, bill inserts, direct mail, and other appropriate methods. Provide schools with age appropriate educational materials and activities. Continue sponsorship of Disney Planet Challenge program.	All customer segments
<b>NON-CORE PROGRAMS</b>		
Toilet/Urinal Direct Install Program	Offer direct installation programs for replacement of non-HE toilets and urinals	All customer segments
Smart Irrigation Controller Contractor Incentives	Offer contractor incentives for installation of smart irrigation controllers	All customer segments
Large Landscape Water Use Reports	Expand existing Cal Water Large Landscape Water Use Report Program providing large landscape customers with monthly water use reports and budgets	Non residential customers with significant landscape water use and potential savings
Large Landscape Surveys & Irrigation System Incentives	Provide surveys and irrigation system upgrade financial incentives to large landscape customers participating in the Large Landscape Water Use Reports programs and other targeted customers	Non residential customers with significant landscape water use and potential savings
Food Industry Rebates/Vouchers	Offer customer/dealer/distributor rebates/vouchers for high-efficiency dishwashers, food steamers, ice machines, and pre-rinse spray valves	Food and drink establishments, institutional food service providers
Cooling Tower Retrofits	Offer customer/dealer/distributor rebates/vouchers of cooling tower retrofits	Non-residential market segments with significant HVAC water use
Industrial Process Audits and Retrofit Incentives	Offer engineering audits/surveys and financial incentives for process water efficiency improvement	Non-residential market segments with significant industrial process water uses

Core and non-core programs were then subjected to a detailed benefit cost analysis, the results of which were used to inform program portfolio development discussed in the next section. The first step in this process was to refine and finalize the savings and cost specifications of each program. The program savings and cost assumptions enable the calculation of program benefits and costs to the utility and its ratepayers, and comparisons of these costs in the form of benefit-cost ratios. The tool used to do this comparison was a simplified version of the Alliance for Water Efficiency Tracking Tool. Following are descriptions of how the model calculates and compares conservation program benefits and costs.

## 6.5 Conservation Program Portfolio

This section presents the recommended conservation program portfolio for the Westlake District. The program analysis results described in the previous section provided the starting point for portfolio development. The next step was to determine the annual levels of program activity needed to, at minimum, meet Westlake District's water savings targets and local demand management goals. Several considerations informed these decisions, including budgetary constraints included in the current GRC decision, Cal Water conservation program administrative capacity, program market and water savings potential, and the program benefit-cost results.

The water savings requirement analysis showed that, after accounting for water savings from existing water efficiency codes and ordinances, scheduled adjustments to water rates, and past investment in conservation programs, projected 2015 baseline demand (excluding recycled water use) in West Lake District is projected to exceed the SBx7-7 target by 1,149 AF and the MOU Flex Track target by 163 AF. The analysis done for this plan suggests the district will not be able to meet its district-specific SBx7-7 target by 2015 and instead will need to rely on the regional compliance option. The reason for this is three-fold. First, the district's extremely high per capita water use results in a large water savings target relative to the size of the district. Second, the relatively small number of non-residential customers in the district will limit the reach of commercial and industrial conservation programs. And third, the amount of conservation investment the district can undertake in 2011 through 2013 is capped by Cal Water's current GRC decision, which will prevent the district from scaling up programs rapidly enough to reach the target. For the Westlake District, the programs selected and the activity level of each are shown in Table 6.5-1.

<b>Table 6.5-1: Recommended Program Levels</b>					
<b>Program</b>	<b>Recommended Annual Activity Levels</b>				
	<b>2011</b>	<b>2012</b>	<b>2013</b>	<b>2014</b>	<b>2015</b>
<b>CORE PROGRAMS</b>					
Rebates/Vouchers					
Toilets	200	200	200	320	320
Clothes Washers	130	130	130	140	140
Urinals	0	0	0	0	0
Customer Surveys/Audits	220	220	220	220	220
Conservation Kit Distribution	220	220	220	220	220
Pop-Up Nozzle Distribution	2,550	2,550	2,550	2,550	2,550
<b>NON-CORE PROGRAMS</b>					
Direct Install Toilets/Urinals	240	240	240	310	310
Smart Irr. Controller Vendor Incentives	20	20	20	200	200
Large Landscape Water Use Reports	70	70	70	100	100
Large Landscape Surveys/Incentives	30	30	30	30	30
Commercial Kitchen Rebates/Vouchers	0	0	0	30	30
Cooling Tower/Process Water Retrofit Incentives	0	0	0	0	0

The program levels for 2011-2013 reflect the funding level approved in Cal Water's most recent General Rate Case (GRC) settlement with the CPUC. Program levels for 2014 and 2015 will be dependent on the outcome of Cal Water's 2014-2016 GRC filing.

Table 6.5-2 shows projected water savings associated with the programs listed above. Projected savings are well below the amount needed to meet the district-specific SBx7-7 target, but exceed the MOU Flex Track target by about 70 percent.

<b>Table 6.5-2: Projected Water Savings by Program</b>					
<b>Program</b>	<b>Annual Water Savings (AF)</b>				
	<b>2011</b>	<b>2012</b>	<b>2013</b>	<b>2014</b>	<b>2015</b>
<b>CORE PROGRAMS</b>					
Rebates/Vouchers					
Toilets	6.1	11.9	17.5	26.2	34.6
Clothes Washers	2.4	4.8	7.0	9.3	11.4
Urinals	0.0	0.0	0.0	0.0	0.0
Customer Surveys/Audits	15.7	29.8	42.6	54.0	64.3
Conservation Kit Distribution	3.3	6.2	8.8	11.0	13.0
Pop-Up Nozzle Distribution	10.2	20.4	30.6	40.8	51.0
<b>Subtotal Core Programs</b>	<b>37.7</b>	<b>73.1</b>	<b>106.4</b>	<b>141.3</b>	<b>174.4</b>
<b>NON-CORE PROGRAMS</b>					
Direct Install Toilets/Urinals	6.9	13.6	19.9	28.4	36.5
Smart Irr. Controller Vendor Incentives	0.6	1.1	1.7	6.9	12.2
Large Landscape Water Use Reports	6.1	6.1	6.1	8.9	8.9
Large Landscape Surveys/Incentives	4.0	8.0	12.1	16.1	20.1
Commercial Kitchen Rebates/Vouchers	0.0	0.0	0.0	12.7	25.3
Cooling Tower/Process Water Retrofit Incentives	0.0	0.0	0.0	0.0	0.0
<b>Subtotal Non-Core Programs</b>	<b>17.7</b>	<b>28.9</b>	<b>39.8</b>	<b>73.0</b>	<b>103.0</b>
<b>Total Core and Non-Core Program Savings</b>	<b>55.4</b>	<b>102.0</b>	<b>146.2</b>	<b>214.3</b>	<b>277.4</b>

Based on the above analysis the district is not projected to achieve its district-specific 2015 SBx7-7 compliance target through the combination of passive savings and the proposed 2011-2015 conservation program portfolio. However, it will achieve compliance with its 2015 SBx7-7 compliance target through the regional alliance. The district may ultimately elect to achieve 2020 SBx7-7 compliance through a regional alliance also. Appendix C, Worksheet 24, includes a comparison of conservation savings required to meet SBx7-7 compliance targets to the savings expected as a result of existing and planned programs, including passive savings due to code changes.

For the purpose of this analysis it is assumed that there will be a linear reduction in GPCD from 2015-2020 to achieve the district-specific 2020 SBx7-7 compliance target. Programs required to achieve 2020 SBx7-7 compliance will be outlined in the next Conservation Master Plan for the district, which will be included in the 2015 UWMP.

The activity level of each future program will depend on Cal Water's success in obtaining the necessary funding through the CPUC rate case process.

As part of the Conservation Master Plan development, one page program summaries, or fact sheets, were developed for each recommended program. These fact sheets provide a quick reference summarizing program design and marketing, expected level of customer participation, projected water savings, and proposed program expenditure for the period 2011 – 2015. The fact sheets for the Westlake District are included in Appendix G.

---

## 7 Climate Change

---

### 7.1 Introduction

Investigating climate change brings the prospect of examining both model-predicted outcomes and unforeseen changes to the environment. These changes may physically affect the water districts that Cal Water serves. Climate change does not just mean a change in average temperature within any particular region, but a change in the climatic conditions that creates or results in an increase in extreme weather events. These potential changes include a more variable climate with risks of extreme climate events that are more severe than those in the recent hydrologic record, in addition to sea level rise, a hotter and drier climate, and the likelihood that more of the uplands precipitation will fall as rain and not as snow.

### 7.2 Strategy

Cal Water intends to prepare a Climate Assessment Report in 2013 that will examine the regional impacts on water supply for each of its 24 service areas. This report will review any supply changes that may occur due to climate change and will outline mitigation and adaption methods to meet the needs of the District's service area. The following section, adapted from DWR's *Guidebook to Assist Water Suppliers to Prepare a 2010 Urban Water Management Plan*, provides a range of topics to be examined in Cal Water's Climate Assessment Report.

Responding to climate change generally takes two forms: mitigation and adaptation. Mitigation is taking steps to reduce our contribution to the causes of climate change by reducing greenhouse gas (GHG) emissions. Adaptation is the process of responding to the effects of climate change by modifying our systems and behaviors to function in a warmer climate. Regardless if climate change is manmade or a result of natural climate cycles, investigating mitigation and adaptive methods to better manage possible uncertainties in climatic changes will have more immediate benefits such as: cutting carbon emissions, reducing energy usage, possible economic development at the local level, and financial savings for Cal Water and the ratepayers.

#### Mitigation

In the water sector, climate change mitigation is generally achieved by reducing energy use, becoming more efficient with energy use, and/or substituting fossil fuel based energy sources for renewable energy sources. Water requires energy to move, treat, use, and discharge, thus water conservation is energy conservation. One possible mitigation method is to calculate conserved energy and GHGs not-emitted as water conservation targets are being met.

#### Adaptation

Climate change means more than just hotter days. Continued warming of the climate system may have considerable impact on the operation of Cal Water Districts, even if indirectly. For example, snow in the Sierra Nevada provides 65 percent of California's

water supply. Predictions indicate that by 2050 the Sierra snowpack will be significantly reduced. Much of the lost snow will fall as rain, which flows quickly down the mountains during winter and cannot be stored in the current water system for use during the summer. This change in water runoff may severely impact groundwater recharge and other water supply networks. The climate is also expected to become more variable, bringing more droughts and floods. Cal Water districts will have to adapt to these new and more variable conditions.

### **7.3 Potential Climate Change Effects**

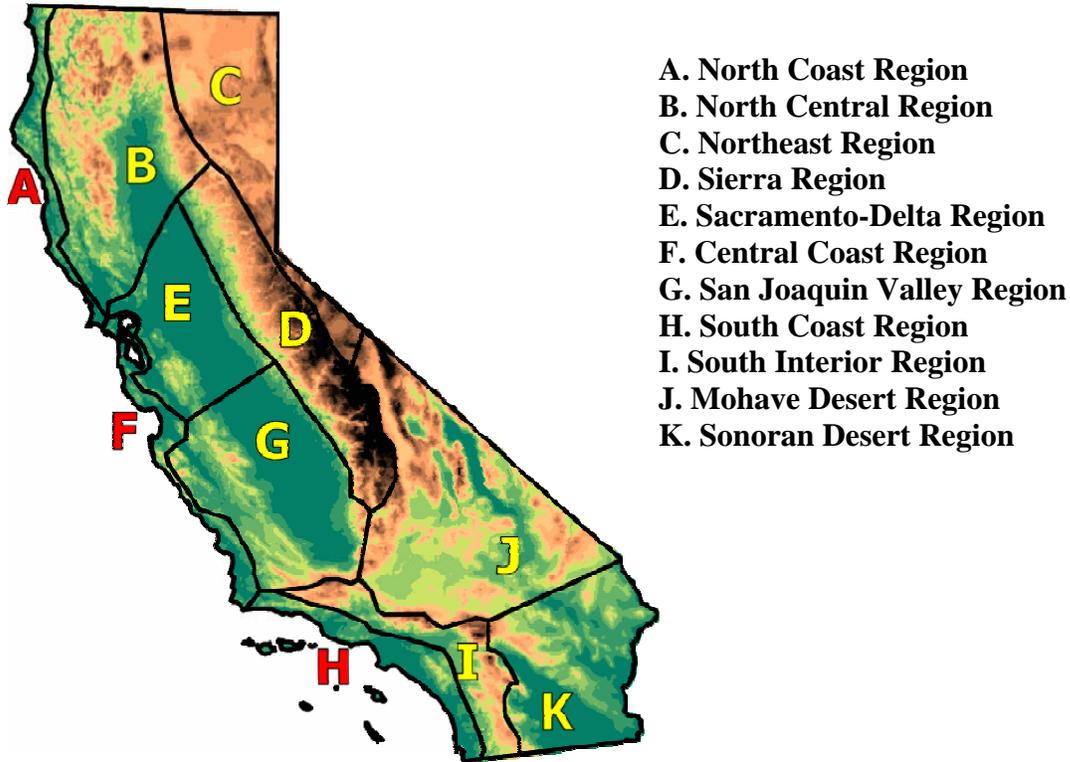

Even in the near term of the next 20 years, DWR has outlined potential climate change effects to water supplies, water demand, sea level, and the occurrence and severity of natural disasters. Some of these potential changes are presented below. Cal Water will investigate the following climate change and the effects on Cal Water's Districts:

- **Water Demand** — Hotter days and nights, as well as a longer irrigation season, will increase landscaping water needs, and power plants and industrial processes will have increased cooling water needs.
- **Water Supply and Quality** — Reduced snowpack, shifting spring runoff to earlier in the year, increased potential for algal bloom, and increased potential for seawater intrusion—each has the potential to impact water supply and water quality.
- **Sea Level Rise** — It is expected that sea level will continue to rise, resulting in near shore ocean changes such as stronger storm surges, more forceful wave energy, and more extreme tides. This will also affect levee stability in low-lying areas and increase flooding.
- **Disaster** — Disasters are expected to become more frequent as climate change brings increased climate variability, resulting in more extreme droughts and floods. This will challenge water supplier operations in several ways as wildfires are expected to become larger and hotter, droughts will become deeper and longer, and floods can become larger and more frequent.

### **7.4 Historical Climate Data Summary**

The National Climatic Data Center (NCDC) has established 11 climate regions within California. Each region is defined by unique characteristics, and is shown in Figure 7.4-1.

Figure 7.4-1: The Climate Regions of California<sup>5</sup>

Cal Water has water service districts in 7 out of 11 of the climate regions. The Westlake District is located in the South Coast Region, as listed in Table 7.4-1.

Table 7.4-1: Cal Water Districts Sorted by Climate Region	
Climate Region	Cal Water Districts in Each Climate Region
North Coast Region	None
North Central Region	Chico-Hamilton City, Redwood Valley
Northeast Region	None
Sierra Region	Kern River Valley
Sacramento-Delta Region	Dixon, Livermore, Marysville, Oroville, Stockton, Willows
Central Coast Region	Bear Gulch, Los Altos, Mid-Peninsula, Salinas, South San Francisco
San Joaquin Valley Region	Bakersfield, King City, Selma, Visalia
South Coast Region	Dominguez, East LA, Hermosa-Redondo, Palos Verdes, <b>Westlake</b>
South Interior Region	None
Mojave Desert Region	Antelope Valley
Sonoran Desert Region	None

<sup>5</sup> [http://www.wrcc.dri.edu/monitor/cal-mon/frames\\_versionSTATIONS.html](http://www.wrcc.dri.edu/monitor/cal-mon/frames_versionSTATIONS.html)

The region has experience a general warming trend as indicated by the maximum, minimum, and mean temperature departure from average. Since 1895 these values have increased by 1.74°F, 3.19°F, and 2.47°F, respectively. More recently, since 1975, the maximum, minimum, and mean temperature departures have increased -0.76°F, 1.76°F, and 0.49°F, respectively. The historical data for these parameters are shown in Figures 7.4-2, 7.4-3, and 7.4-4.

Figure 7.4-2: Maximum Temperature Departure for South Coast Region

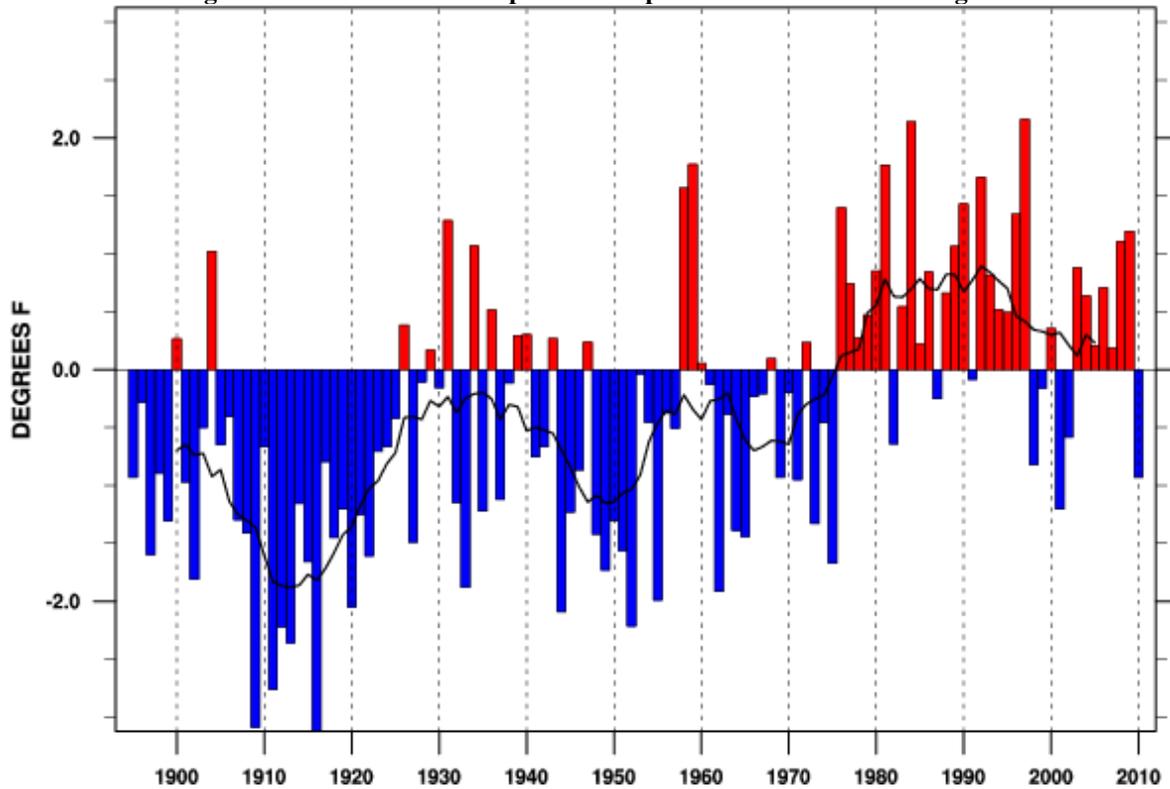

Figure 7.4-3: Mean Temperature Departure for South Coast Region

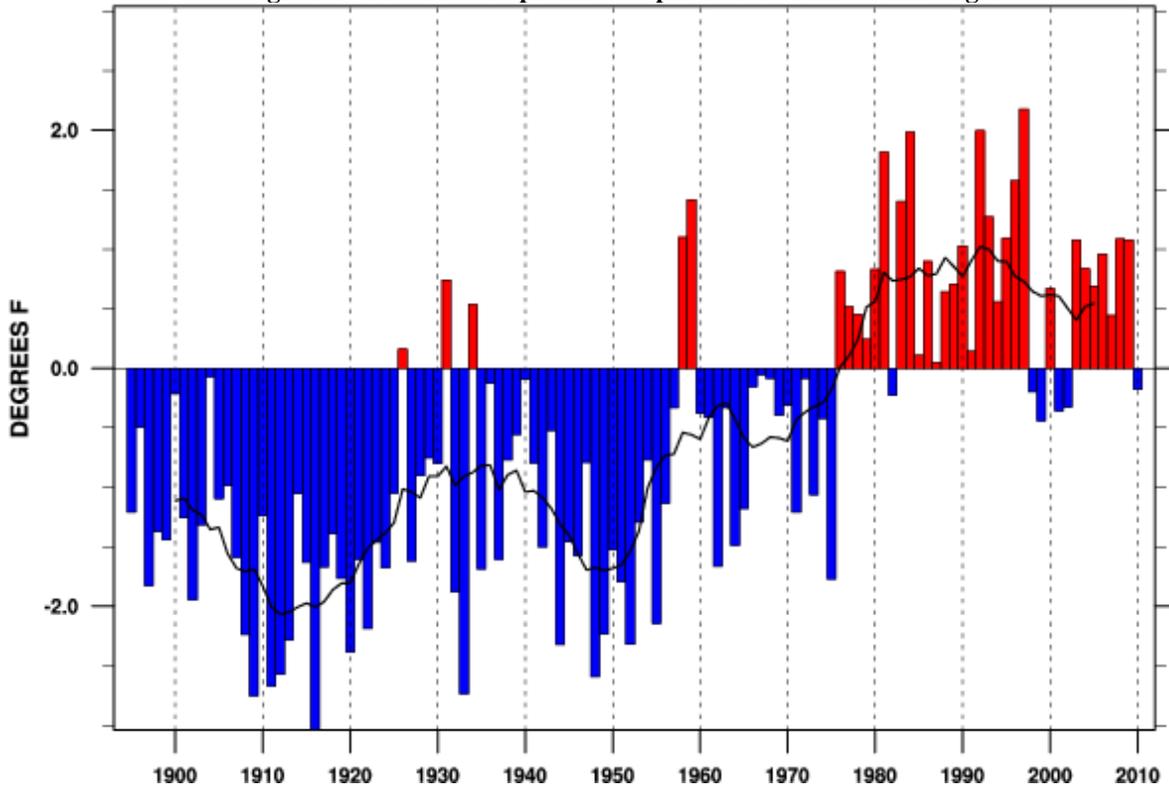

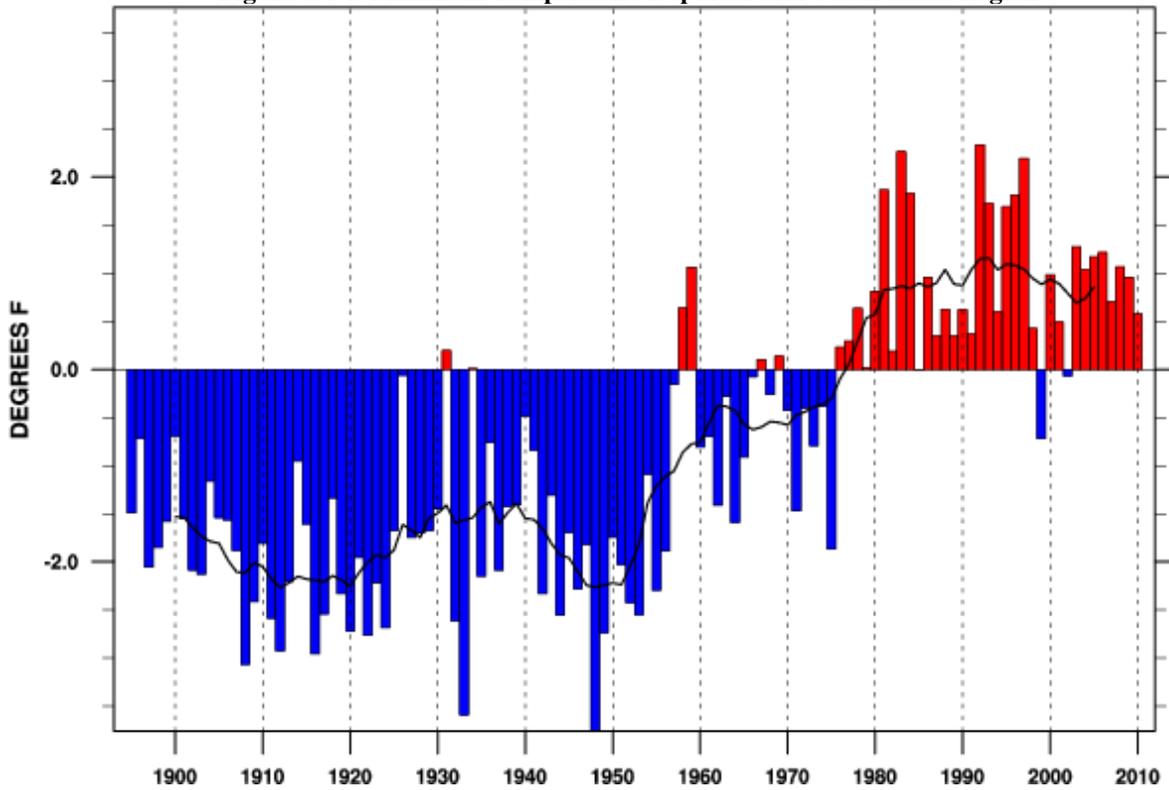

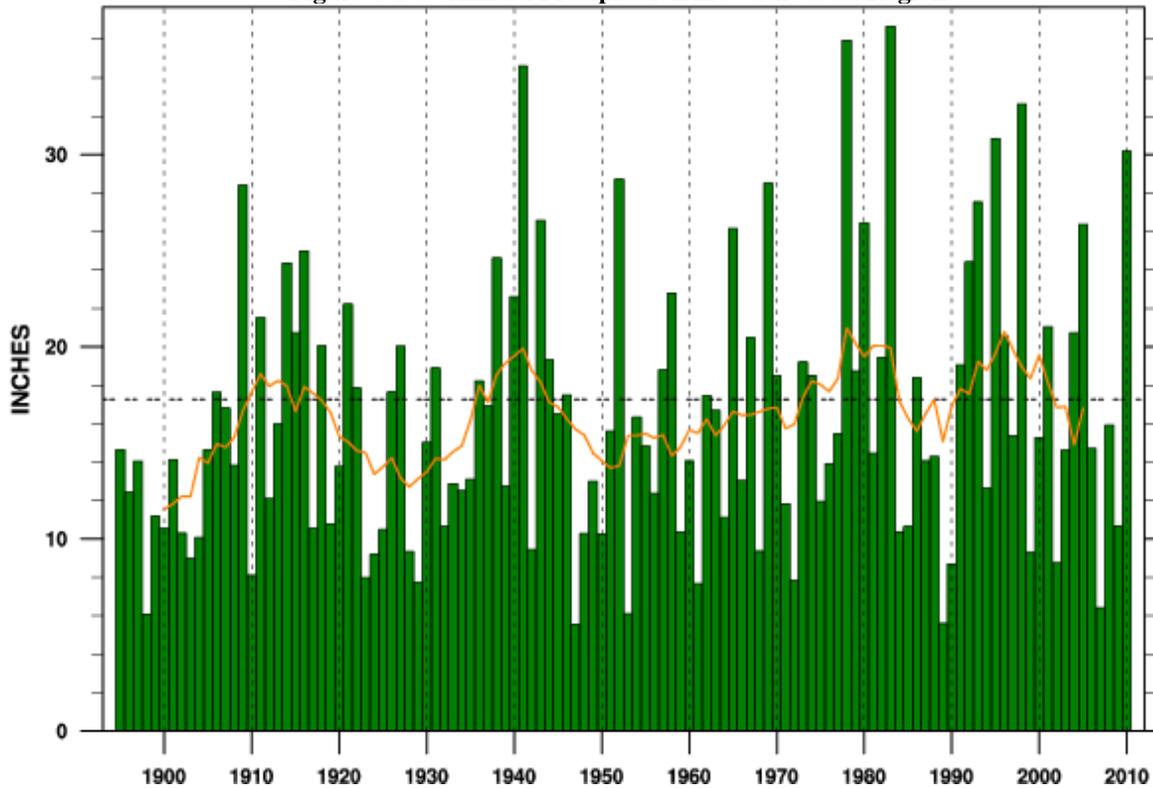

Figure 7.4-4: Minimum Temperature Departure for South Coast Region

Variation in annual rainfall totals has also shown an increasing trend since 1900 with more deviation from average occurring in recent decades as compared to earlier part of the century.

Figure 7.4-5: Annual Precipitation in South Coast Region

Historical data is showing a general correlation as to the general consensus for the different climate change scenarios. As stated above, a more comprehensive investigation will be prepared by Cal Water in 2013. The outcome of this report will outline mitigation and adaptation methods that will provide water supply reliability for Cal Water’s service areas.

### 7.5 Climate Change Guidance

The California Department of Water Resources is currently in the process of compiling the potential actions and responses to climate change in the Integrated Regional Water Management (IRWM) climate change handbook. This handbook will provide guidance to water utilities for planning for the potential impacts of climate change and will offer a framework for responding to these impacts. Cal Water will review this handbook and other available literature when developing localized strategies for each of its water service districts.

## 8 Completed UWMP Checklist

### 8.1 Review Checklist

Table 8.1-1, adapted from DWR's *Guidebook to Assist Water Suppliers to Prepare a 2010 Urban Water Management Plan*, is included as a reference to assist DWR staff in review of this UWMP.

Table 8.1-1: Urban Water Management Plan Checklist (organized by legislation number)					
No.	UWMP requirement <sup>a</sup>	Calif. Water Code reference	Subject <sup>b</sup>	Additional clarification	UWMP location
1	Provide baseline daily per capita water use, urban water use target, interim urban water use target, and compliance daily per capita water use, along with the bases for determining those estimates, including references to supporting data.	10608.20(e)	Water Conservation		3.3.1
2	Include an assessment of present and proposed future measures, programs, and policies to help achieve the water use reductions.	10608.36	Water Conservation		6.4
3	Report progress in meeting urban water use targets using the standardized form.	10608.4	Water Conservation		Appendix G
4	Each urban water supplier shall coordinate the preparation of its plan with other appropriate agencies in the area, including other water suppliers that share a common source, water management agencies, and relevant public agencies, to the extent practicable.	10620(d)(2)	External Coordination and Outreach		1.2
5	An urban water supplier shall describe in the plan water management tools and options used by that entity that will maximize resources and minimize the need to import water from other regions.	10620(f)	Water Supply (Water Management)		1.4
6	Every urban water supplier required to prepare a plan pursuant to this part shall, at least 60 days prior to the public hearing on the plan required by Section 10642, notify any city or county within which the supplier provides water supplies that the urban water supplier will be reviewing the plan and considering amendments or changes to the plan. The urban water supplier may consult with, and obtain comments from, any city or county that receives notice pursuant to this subdivision.	10621(b)	External Coordination and Outreach		1.2
7	The amendments to, or changes in, the plan shall be adopted and filed in the manner set forth in Article 3 (commencing with Section 10640).	10621(c)	External Coordination and Outreach		1.2
8	Describe the service area of the supplier	10631(a)	Service Area		2.1
9	(Describe the service area) climate	10631(a)	Service Area		2.3
10	(Describe the service area) current and projected population. . . The projected population estimates shall be based upon data from the state, regional, or local service agency population projections within the service area of the urban water supplier . . .	10631(a)	Service Area	Provide the most recent population data possible. Use the method described in "Baseline Daily Per Capita Water Use." See Section M.	2.2

11	... (population projections) shall be in five-year increments to 20 years or as far as data is available.	10631(a)	Service Area	2035 and 2040 can also be provided to support consistency with Water Supply Assessments and Written Verification of Water Supply documents.	2.2
12	Describe ... other demographic factors affecting the supplier's water management planning	10631(a)	Service Area		2.2
13	Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a).	10631(b)	Water Supply	The 'existing' water sources should be for the same year as the "current population" in line 10. 2035 and 2040 can also be provided to support consistency with Water Supply Assessments and Written Verification of Water Supply documents.	4.1
14	(Is) groundwater ... identified as an existing or planned source of water available to the supplier ...?	10631(b)	Water Supply	Source classifications are: surface water, groundwater, recycled water, storm water, desalinated sea water, desalinated brackish groundwater, and other.	4.4
15	(Provide a) copy of any groundwater management plan adopted by the urban water supplier, including plans adopted pursuant to Part 2.75 (commencing with Section 10750), or any other specific authorization for groundwater management. Indicate whether a groundwater management plan been adopted by the water supplier or if there is any other specific authorization for groundwater management. Include a copy of the plan or authorization.	10631(b)(1)	Water Supply		4.4.2
16	(Provide a) description of any groundwater basin or basins from which the urban water supplier pumps groundwater.	10631(b)(2)	Water Supply		4.4.1
17	For those basins for which a court or the board has adjudicated the rights to pump groundwater, (provide) a copy of the order or decree adopted by the court or the board	10631(b)(2)	Water Supply		N/A

18	(Provide) a description of the amount of groundwater the urban water supplier has the legal right to pump under the order or decree.	10631(b)(2)	Water Supply		N/A
19	For basins that have not been adjudicated, (provide) 10631(b)(2) Water Supply information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current official departmental bulletin that characterizes the condition of the groundwater basin, and a detailed description of the efforts being undertaken by the urban water supplier to eliminate the long-term overdraft condition.	10631(b)(2)	Water Supply		4.4.1
20	(Provide a) detailed description and analysis of the location, amount, and sufficiency of groundwater pumped by the urban water supplier for the past five years. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.	10631(b)(3)	Water Supply		4.4
21	(Provide a) detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the urban water supplier. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.	10631(b)(4)	Water Supply	Provide projections for 2015, 2020, 2025, and	4.4
22	Describe the reliability of the water supply and vulnerability to seasonal or climatic shortage, to the extent practicable, and provide data for each of the following: (A) An average water year, (B) A single dry water year, (C) Multiple dry water years.	10631(c)(1)	Reliability		5.3
23	For any water source that may not be available at a consistent level of use - given specific legal, environmental, water quality, or climatic factors - describe plans to supplement or replace that source with alternative sources or water demand management measures, to the extent practicable.	10631(c)(2)	Reliability		5.1
24	Describe the opportunities for exchanges or transfers of water on a short-term or long-term basis.	10631(d)	Water Supply (Transfers)		4.7
25	Quantify, to the extent records are available, past and current water use, and projected water use (over the same five-year increments described in subdivision (a)), identifying the uses among water use sectors, including, but not necessarily limited to, all of the following uses: (A) Single-family residential; (B) Multifamily; (C) Commercial; (D) Industrial; (E) Institutional and governmental; (F) Landscape; (G) Sales to other agencies; (H) Saline water intrusion barriers, groundwater recharge, or conjunctive use, or any combination thereof;(I) Agricultural.	10631(e)(1)	Water Demands	Consider "past" to be 2005, present to be 2010, and projected to be 2015, 2020, 2025, and 2030. Provide numbers for each category for each of these years.	3.3

26	(Describe and provide a schedule of implementation for each water demand management measure that is currently being implemented, or scheduled for implementation, including the steps necessary to implement any proposed measures, including, but not limited to, all of the following: (A) Water survey programs for single-family residential and multifamily residential customers; (B) Residential plumbing retrofit; (C) System water audits, leak detection, and repair; (D) Metering with commodity rates for all new connections and retrofit of existing connections; (E) Large landscape conservation programs and incentives; (F) High-efficiency washing machine rebate programs; (G) Public information programs; (H) School education programs; (I) Conservation programs for commercial, industrial, and institutional accounts; (J) Wholesale agency programs; (K) Conservation pricing; (L) Water conservation coordinator; (M) Water waste prohibition; (N) Residential ultra low-flush toilet replacement programs.	10631(f)(1)	DMMs	Discuss each DMM, even if it is not currently or planned for implementation. Provide any appropriate schedules.	6.5
27	A description of the methods, if any, that the supplier will use to evaluate the effectiveness of water demand management measures implemented or described under the plan.	10631(f)(3)	DMMs		6.2
28	An estimate, if available, of existing conservation savings on water use within the supplier's service area, and the effect of the savings on the supplier's ability to further reduce demand.	10631(f)(4)	DMMs		6.3
29	An evaluation of each water demand management measure listed in paragraph (1) of subdivision (f) that is not currently being implemented or scheduled for implementation. In the course of the evaluation, first consideration shall be given to water demand management measures, or combination of measures, that offer lower incremental costs than expanded or additional water supplies. This evaluation shall do all of the following: (1) Take into account economic and noneconomic factors, including environmental, social, health, customer impact, and technological factors; (2) Include a cost-benefit analysis, identifying total benefits and total costs; (3) Include a description of funding available to implement any planned water supply project that would provide water at a higher unit cost; (4) Include a description of the water supplier's legal authority to implement the measure and efforts to work with other relevant agencies to ensure the implementation of the measure and to share the cost of implementation.	10631(g)	DMMs	See 10631(g) for additional wording.	6.4

30	(Describe) all water supply projects and water supply programs that may be undertaken by the urban water supplier to meet the total projected water use as established pursuant to subdivision (a) of Section 10635. The urban water supplier shall include a detailed description of expected future projects and programs, other than the demand management programs identified pursuant to paragraph (1) of subdivision (f), that the urban water supplier may implement to increase the amount of the water supply available to the urban water supplier in average, single-dry, and multiple-dry water years. The description shall identify specific projects and include a description of the increase in water supply that is expected to be available from each project. The description shall include an estimate with regard to the implementation timeline for each project or program.	10631(h)	Water Supply		4.9
31	Describe the opportunities for development of desalinated water, including, but not limited to, ocean water, brackish water, and groundwater, as a long-term supply.	10631(i)	Water Supply		4.6
32	Include the annual reports submitted to meet the Section 6.2 requirement (of the MOU), if a member of the CUWCC and signer of the December 10, 2008 MOU.	10631(j)	DMMs	Signers of the MOU that submit the biannual reports are deemed	6.5
33	Urban water suppliers that rely upon a wholesale agency for a source of water shall provide the wholesale agency with water use projections from that agency for that source of water in five-year increments to 20 years or as far as data is available. The wholesale agency shall provide information to the urban water supplier for inclusion in the urban water supplier's plan that identifies and quantifies, to the extent practicable, the existing and planned sources of water as required by subdivision (b), available from the wholesale agency to the urban water supplier over the same five-year increments, and during various water-year types in accordance with subdivision (c). An urban water supplier may rely upon water supply information provided by the wholesale agency in fulfilling the plan informational requirements of subdivisions (b) and (c).	10631(k)	Water Supply	Average year, single dry year, multiple dry years for 2015, 2020, 2025, and 2030.	N/A
34	The water use projections required by Section 10631 shall include projected water use for single-family and multifamily residential housing needed for lower income households, as defined in Section 50079.5 of the Health and Safety Code, as identified in the housing element of any city, county, or city and county in the service area of the supplier.	10631.1(a)	Water Demands		3.3.2
35	Stages of action to be undertaken by the urban water supplier in response to water supply shortages, including up to a 50 percent reduction in water supply, and an outline of specific water supply conditions which are applicable to each stage.	10632(a)	Contingency		5.3.5
36	Provide an estimate of the minimum water supply available during each of the next three water years based on the driest three-year historic sequence for the agency's water supply.	10632(b)	Contingency		5.2

37	(Identify) actions to be undertaken by the urban water supplier to prepare for, and implement during, a catastrophic interruption of water supplies including, but not limited to, a regional power outage, an earthquake, or other disaster.	10632(c)	Contingency		5.3.9
38	(Identify) additional, mandatory prohibitions against specific water use practices during water shortages, including, but not limited to, prohibiting the use of potable water for street cleaning.	10632(d)	Contingency		5.3.7
39	(Specify) consumption reduction methods in the most restrictive stages. Each urban water supplier may use any type of consumption reduction methods in its water shortage contingency analysis that would reduce water use, are appropriate for its area, and have the ability to achieve a water use reduction consistent with up to a 50 percent reduction in water supply.	10632(e)	Contingency		5.3.5
40	(Indicated) penalties or charges for excessive use, where applicable.	10632(f)	Contingency		5.3.7
41	An analysis of the impacts of each of the actions and conditions described in subdivisions (a) to (f), inclusive, on the revenues and expenditures of the urban water supplier, and proposed measures to overcome those impacts, such as the development of reserves and rate adjustments.	10632(g)	Contingency		5.3.8
42	(Provide) a draft water shortage contingency resolution or ordinance.	10632(h)	Contingency		5.3
43	(Indicate) a mechanism for determining actual reductions in water use pursuant to the urban water shortage contingency analysis.	10632(i)	Contingency		5.3.7
44	Provide, to the extent available, information on recycled water and its potential for use as a water source in the service area of the urban water supplier. The preparation of the plan shall be coordinated with local water, wastewater, groundwater, and planning agencies that operate within the supplier's service area	10633	Recycled Water		4.5
45	(Describe) the wastewater collection and treatment systems in the supplier's service area, including a quantification of the amount of wastewater collected and treated and the methods of wastewater disposal.	10633(a)	Recycled Water		4.5.1
46	(Describe) the quantity of treated wastewater that meets recycled water standards, is being discharged, and is otherwise available for use in a recycled water project.	10633(b)	Recycled Water		4.5.2
47	(Describe) the recycled water currently being used in the supplier's service area, including, but not limited to, the type, place, and quantity of use.	10633(c)	Recycled Water		4.5.3
48	(Describe and quantify) the potential uses of recycled water, including, but not limited to, agricultural irrigation, landscape irrigation, wildlife habitat enhancement, wetlands, industrial reuse, groundwater recharge, indirect potable reuse, and other appropriate uses, and a determination with regard to the technical and economic feasibility of serving those uses.	10633(d)	Recycled Water		4.5.3
49	(Describe) The projected use of recycled water within the supplier's service area at the end of 5, 10, 15, and 20 years, and a description of the actual use of recycled water in comparison to uses previously projected pursuant to this subdivision.	10633(e)	Recycled Water		4.5.3
50	(Describe the) actions, including financial incentives, which may be taken to encourage the use of recycled water, and the projected results of these actions in terms of acre-feet of recycled water used per year.	10633(f)	Recycled Water		4.5

51	(Provide a) plan for optimizing the use of recycled water in the supplier's service area, including actions to facilitate the installation of dual distribution systems, to promote recirculating uses, to facilitate the increased use of treated wastewater that meets recycled water standards, and to overcome any obstacles to achieving that increased use.	10633(g)	Recycled Water		4.5
52	The plan shall include information, to the extent practicable, relating to the quality of existing sources of water available to the supplier over the same five-year increments as described in subdivision (a) of Section 10631, and the manner in which water quality affects water management strategies and supply reliability.	10634	Water Supply (Water Quality)	For years 2010, 2015, 2020, 2025, and 2030	5.2.4
53	Every urban water supplier shall include, as part of its urban water management plan, an assessment of the reliability of its water service to its customers during normal, dry, and multiple dry water years. This water supply and demand assessment shall compare the total water supply sources available to the water supplier with the total projected water use over the next 20 years, in five-year increments, for a normal water year, a single dry water year, and multiple dry water years. The water service reliability assessment shall be based upon the information compiled pursuant to Section 10631, including available data from state, regional, or local agency population projections within the service area of the urban water supplier.	10635(a)	Reliability		5.2
54	The urban water supplier shall provide that portion of its urban water management plan prepared pursuant to this article to any city or county within which it provides water supplies no later than 60 days after the submission of its urban water management plan.	10635(b)	External Coordination and Outreach		1.2
55	Each urban water supplier shall encourage the active involvement of diverse social, cultural, and economic elements of the population within the service area prior to and during the preparation of the plan.	10642	External Coordination and Outreach		1.2
56	Prior to adopting a plan, the urban water supplier shall make the plan available for public inspection and shall hold a public hearing thereon. Prior to the hearing, notice of the time and place of hearing shall be published within the jurisdiction of the publicly owned water supplier pursuant to Section 6066 of the Government Code. The urban water supplier shall provide notice of the time and place of hearing to any city or county within which the supplier provides water supplies. A privately owned water supplier shall provide an equivalent notice within its service area.	10642	External Coordination and Outreach		1.2
57	After the hearing, the plan shall be adopted as prepared or as modified after the hearing.	10642	External Coordination and Outreach		1.3
58	An urban water supplier shall implement its plan adopted pursuant to this chapter in accordance with the schedule set forth in its plan.	10643	External Coordination and Outreach		1.6
59	An urban water supplier shall submit to the department, the California State Library, and any city or county within which the supplier provides water supplies a copy of its plan no later than 30 days after adoption. Copies of amendments or changes to the plans shall be submitted to the department, the California State Library, and any city or county within which the supplier provides water supplies within 30 days after adoption.	10644(a)	External Coordination and Outreach		1.3

60	Not later than 30 days after filing a copy of its plan with the department, the urban water supplier and the department shall make the plan available for public review during normal business hours.	10645	External Coordination and Outreach		1.3
<p><sup>a</sup> The UWMP Requirement descriptions are general summaries of what is provided in the legislation. Urban water suppliers should review the exact legislative wording prior to submitting its UWMP.</p>					
<p><sup>b</sup> The Subject classification is provided for clarification only. A water supplier is free to address the UWMP Requirement anywhere with its UWMP, but is urged to provide clarification to DWR to facilitate review for completeness.</p>
