Management of the California State Water Project

Covers Activities during Calendar Year 1999

Gray Davis, Governor
State of California

Mary D. Nichols, Secretary for Resources
The Resources Agency

Thomas M. Hannigan, Director
Department of Water Resources

Foreword

Bulletin 132-00, *Management of the California State Water Project*, continues the Bulletin 132 annual series begun in 1963. Bulletin 132-00 updates water supply planning, construction, financing, management, and operation activities of the State Water Project. Appendix B contains data and computations used to determine the State Water Project contractors' Statement of Charges for 2001. A preliminary Appendix B was previously published as an individual document.

The Bulletin discusses significant events and issues that affect SWP management and operations. The Bulletin covers the period from January 1, 1999, to December 31, 1999.

Bulletin 132-00 also discusses water supply and delivery; the start of construction of the East Branch Extension; Delta resources and environmental issues, including the CALFED Bay-Delta Program; Oroville facilities relicensing; financial analysis of the SWP; and the update of business systems in the Department.

Thomas M. Hannigan
Director

Executive Summary

A Delta waterway with Mount Diablo
in the background

The Bulletin 132 series began in 1963 and reported the first deliveries of water by the new State Water Project, which was still under construction. Bulletin 132-00, *Management of the California State Water Project*, continues the series with the thirty-seventh edition. It reports planning, construction, financing, managing, and operating activities of the SWP in 1999. The SWP is operated and maintained by the California Department of Water Resources.

New Director Appointed

Thomas M. Hannigan, a former legislator and county supervisor, was appointed Director of the Department of Water Resources on March 1, 1999. Hannigan is a veteran of public service at the city, county, and State levels. For 18 years, he was an Assemblyman from Solano County. From 1986 to 1996, he served as Majority Floor Leader in the Assembly. As a legislator, Hannigan supported a bill that put Proposition 204—the Safe, Clean, Reliable Water Supply Act—on the November 1996 ballot. He also authored legislation to provide funding for restoration of Delta levees.

1999 Highlights

The SWP is one of the largest water and power systems in the world. It conveys an average annual 2.4 million acre-feet of water to the long-term water contractors through its 17 pumping plants, 8 hydroelectric power plants (including 3 pumping-generating plants), 28 dams and reservoirs, and more than 660 miles of aqueducts and pipelines.

In 1999, the SWP delivered 4,095,269 acre-feet of water to 27 of its 29 long-term water contractors and 17 other agencies. The project provides water for approximately 22 million people throughout the State, irrigation for 600,000 acres of farm land, and environmental benefits to wildlife refuges as well as environmental mitigation programs.

Deliveries to Southern California continued despite repairs to both the East and West Branches of the California Aqueduct during 1999.

The SWP facilitated the transfer or exchange of 144,894 acre-feet of entitlement water among SWP long-term contractors and non-SWP agencies, delivered 60,283 acre-feet of CVP water conveyed through SWP facilities, and provided 1,131,701 acre-feet to water rights holders within the SWP service area.

Construction of Phase I of the East Branch Extension for San Bernardino and Riverside Counties started on February 26, 1999, with the issuance of a Notice to Begin Work. The official groundbreaking ceremony took place on August 23, 1999.

The Department continued to be its own energy scheduling coordinator with the California Independent Systems Operator and to schedule the purchase and sale of energy to operate the SWP in 1999.

The project continued to pay bondholders as scheduled and remained financially viable. The long-term water contractors continued to repay project construction bonds and operating expenses. In 1999, the SWP handled approximately \$600 million in income and approximately \$600 million in expenses, with general fund contributions limited to recreation facilities.

1999 Precipitation and Water Storage

The water stored and delivered by the SWP conservation and transportation facilities originates from

rainfall and snowmelt in Northern and Central California watersheds, where most of the State's precipitation occurs.

The Department monitors and records annual precipitation and runoff during water years, which run from September 30 to October 1.

Precipitation in Water Year 1998-99

Water year 1998-99 was the fifth wet year in a row for Northern California, but less so than the previous very wet year. Surface temperature patterns in the Pacific switched from El Niño to La Niña, and California precipitation followed a typical La Niña pattern of dry in Southern California and above average in the northern part of the State. The north to south gradient in annual precipitation, snowpack, and runoff in the southern Sierra Nevada was one of the steepest in California history.

The first part of October 1998 was drier than average but November was quite wet, nearly double normal in the northern Sierra. December started wet and then turned dry and very cold. It was the coldest winter since the big freeze of December 1990.

Estimated statewide precipitation for January was 95 percent of average. A major January storm brought a record-breaking 2.82 inches of precipitation, both snow and rain, to the City of Bakersfield over a 2-day period, providing almost half of the city's annual precipitation of 5.72 inches. Fast-moving storms in February produced great amounts of rain and snow in Northern California only, resulting in 200 percent of average precipitation in the north and 30 percent of average in the southeastern regions. March rainfall, slightly below normal, resulted in 80 percent of average precipitation statewide.

Strong shower activity during the first half of April in the coastal and desert regions boosted statewide precipitation to above average (125 percent) for the month. May was dry and cooler than normal. June was also dry in the northern part of the State. July, usually the driest month, was no exception in 1999, with monthly rainfall below average. August began cool, but ended with several days of over 100 degree temperatures in the Central Valley and scattered

thunderstorms in Northern California. September was dry (about 25 percent of average precipitation). The water year closed with a statewide estimate of 95 percent of average precipitation.

Precipitation in the First Quarter of Water Year 1999-00

October 1999 was mainly dry, but a powerful Pacific storm brought substantial rain to Northern California at the end of the month, while the San Joaquin Valley and Southern California remained dry. November continued the strong north to south gradient, as precipitation was near average in Northern California and below average in the south. December was one of the State's driest winter months, with only 15 percent of normal monthly precipitation. By the end of December, Sierra precipitation had declined to 60 percent of average, while statewide precipitation had fallen to 40 percent of average, and the mountain snowpack contained only one-quarter of its average December 31 water content.

Runoff

Runoff in the Central Valley rivers in water year 1998-99 was less than water year 1997-98, but still well above average, except in the southern end of the Sierra from the Merced River south. Water year 1998-99 was classified as *above normal*, ending the run of 4 consecutive wet years on the San Joaquin River system.

Storage

Total storage in major SWP reservoirs was 3.66 million acre-feet on September 30, 1998, the end of water year 1998-99. Total storage in major SWP reservoirs at the end of calendar year 1999 was 3.53 million acre-feet.

1999 Water Supplies, Contracts, and Deliveries

Water Deliveries

In March 1999, the Department announced projected deliveries of 3.19 million acre-feet of entitlement water in 1999, 100 percent of the amount requested by the 29 long-term water contractors. Because of adequate snowpack and runoff in 1999, contractors did not require the entire amount they originally

^a Includes water conveyed for SWP and non-SWP water contractors.
^b Includes amounts of water diverted according to various water rights agreements.

requested. SWP deliveries were greater in 1999 than 1998, due largely to drier conditions south of the Delta. The SWP met all contractors' demands for entitlement water. Table ES-1 shows SWP water deliveries by category for the years 1962-99.

The SWP delivered 2,738,891 acre-feet of entitlement water in 1999. This included 2,391,985 acre-feet delivered to 27 long-term water contractors; 130,969 acre-feet transferred to or exchanged with Westlands Water District; and 215,937 acre-feet of purchase pool water. In addition, a total of 158,070 acre-feet of Article 21 water was delivered to the SWP long-term contractors.

Nonproject Water. The long-term water contractors received 25,029 acre-feet of nonproject water, making a total of 2,921,990 acre-feet of entitlement and nonproject water delivered to the contractors.

The SWP also delivered 4,324 acre-feet of recreation/fish and wildlife water and 1,193,984 acre-feet of nonentitlement water to satisfy water rights settlement holders and agreements made with SWP contractors and other agencies, including the U.S. Bureau of Reclamation.

Water rights water is transported through SWP facilities to long-term SWP contractors and other agencies, according to terms of various local water rights agreements. Water may pass through SWP transportation facilities or a portion may be stored in SWP reservoirs for release at a later time.

Two South Bay Aqueduct contractors holding water rights to runoff from the Lake Del Valle watershed received 23,016 acre-feet of local water; 13 acre-feet of local runoff were delivered to a contractor in Southern California under local water rights; and nine nonproject agencies in the Feather River area received 1,108,672 acre-feet.

The Feather River water rights settlement contractors are agencies that held water rights for Feather River water before the SWP was built. The Department negotiated settlements with these water rights holders and agreed to deliver a regulated water supply from Oroville in exchange for the agencies' agreement concerning their Feather River water rights.

In addition, the Department conveyed 60,283 acre-feet of CVP water through SWP facilities for USBR.

Specific information regarding delivery amounts and locations can be found in Chapter 9.

Aqueduct Repairs

Deliveries to Southern California continued despite repairs to both the East and West Branches of the California Aqueduct during 1999.

About \$4.2 million worth of work to repair damage to canal lining and pipeline sections on the West Branch near Gorman and on the East Branch near Lancaster was completed in May 1999. This work consisted of relining damaged canal lining that had cracked and settled over time. While repairs were being done, deliveries were made through other parts of the Aqueduct from SWP's nearly full Southern California storage reservoirs.

Later in the year, repairs were made on approximately 3,500 linear feet of concrete canal at three locations along the East Branch near Palmdale. The \$4 million repairs, which involved replacing broken concrete panels, sealing joints, and installing new watertight lining over the existing panels, were made during a low demand period while reservoirs at Silverwood and Castaic Lakes could provide water for uninterrupted deliveries. Work began the first week in November and crews labored around the clock to finish the repairs in a little over 3 weeks.

Monterey Amendments

In 1999, the Department executed one Monterey Amendment with Ventura County Flood Control District. Plumas County Flood Control and Water Conservation District and Empire West Side Irrigation District remain the only long-term water contractors who have not signed the Monterey Agreement.

Financial Analysis

In 1999, the Department continued to pay bondholders as scheduled. The SWP was financially viable and was indirectly paid for by the approximately 22 million water users who were served by the project. Direct payment was through the 29 long-term water contractors. In 1999, the SWP handled

1999 Income Statement for the State Water Project	
Revenues	Thousands of Dollars
Water contractor payments	674,990
Revenue bond cover adjustments	(40,473)
Rate management adjustments	(32,000)
Other revenue	16,400
Total operating revenues	618,917
Expenses	Thousands of Dollars
Project operations, maintenance, and power	346,916
Deposits to reserves	(275)
Water bond principal	85,905
Water bond interest	180,371
Total operating expenses and debt service	612,917
Net system revenues	6,000

approximately \$600 million in income and \$600 million in expenses. The sidebar above shows a 1999 income statement for the SWP.

Project Development

East Branch Extension

In 1999, construction began on Phase I of the East Branch Extension of the California Aqueduct, which will bring SWP water to Yucaipa, Calimesa, Beaumont, Banning, and other nearby communities; improve groundwater supplies in the Beaumont Storage Basin; and add flexibility to wheel local supplies within the San Bernardino Valley Municipal Water District service area.

The official groundbreaking ceremony for the East Branch Extension took place in Yucaipa on August 23, 1999. It is anticipated that the project will start operating in fall 2002.

The Department is working with two regional water agencies—San Gorgonio Pass Water Agency and SBVMWD—to build the pipeline. SGPWA is the last original contractor to receive SWP water.

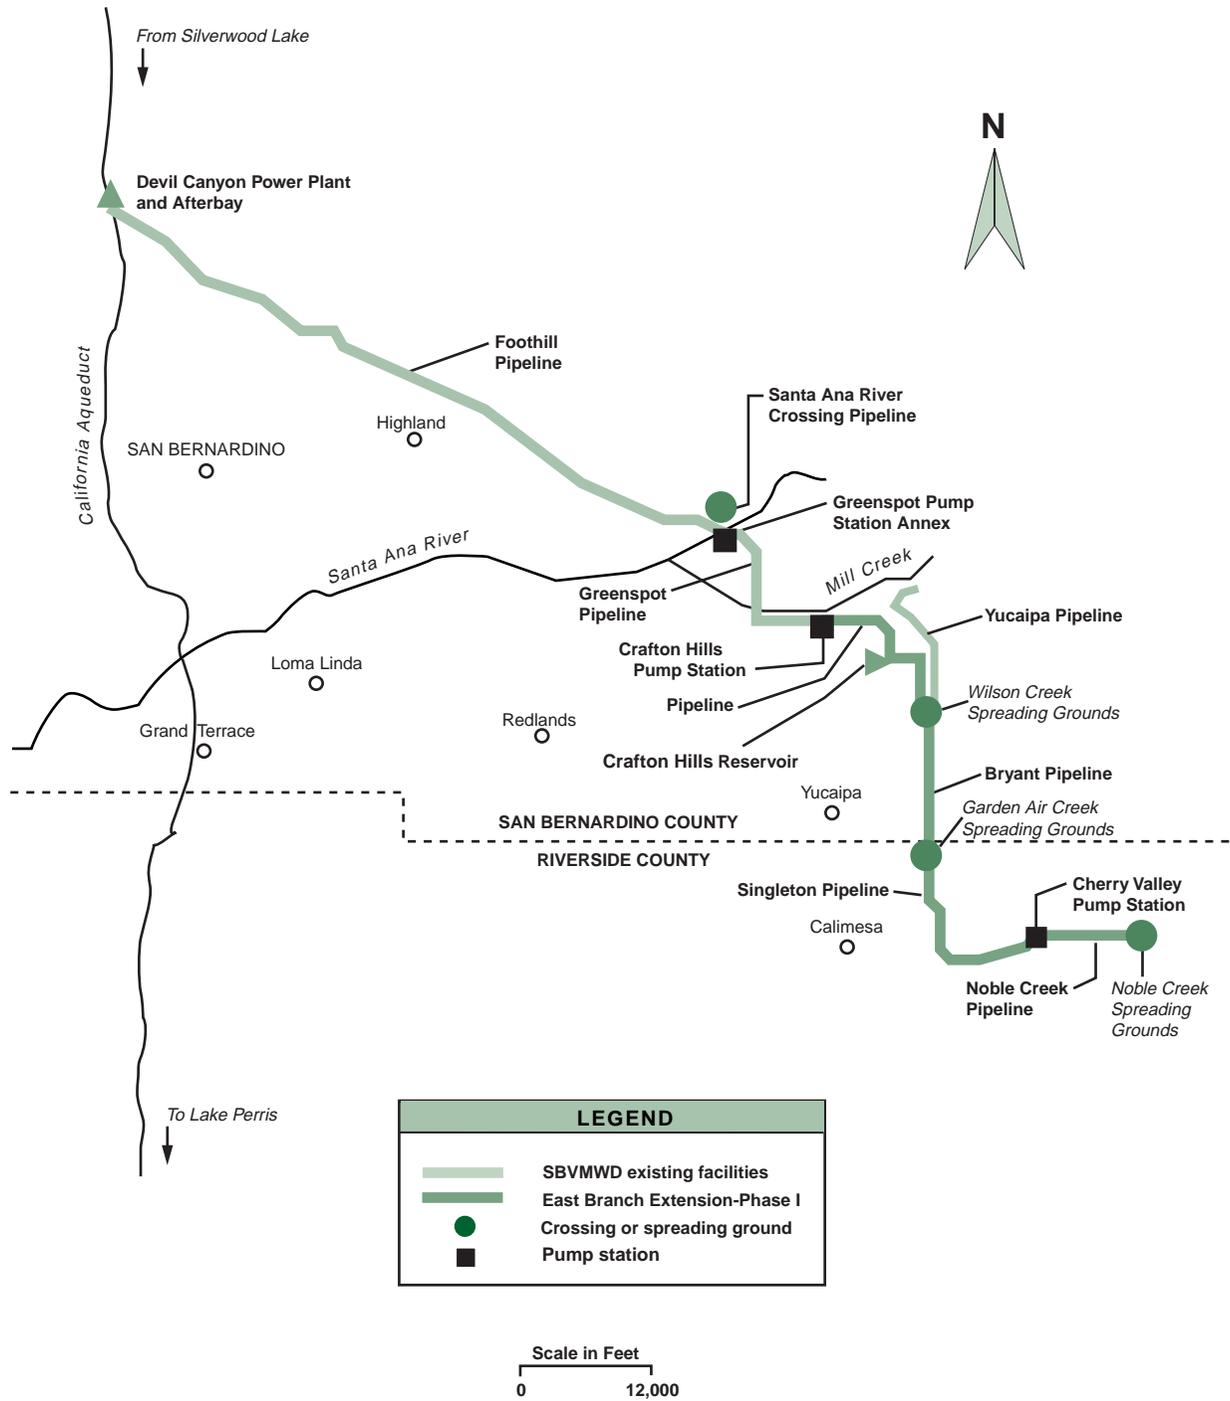

The completed East Branch Extension will include a reservoir in Crafton Hills and three pump stations—two of them new—that will link parts of SBVMWD's service area and the eastern part of SGPWA's service area to the California Aqueduct. Phase I will include construction of about 13 miles of new pipeline and the use of approximately 19 miles of pipeline owned by SBVMWD as an interim delivery system. When the needs of SGPWA surpass 16 cfs, Phase II of the East Branch Extension will be built to bypass the SBVMWD Greenspot pipeline and pump station, which have limited capacity.

The Phase I pipeline will consist of about 13 miles of buried pipe in three contract reaches, conveying water from the Crafton Hills Pumping Station through Crafton Hills Reservoir and Cherry Valley Pumping Station to the Noble Creek Spreading Grounds.

A map of the East Branch Extension, Phase I area, is shown in Figure ES-1.

Contracts Awarded. As of December 31, 1999, eight of the 14 anticipated construction contracts had

**Figure ES-1
East Branch Extension, Phase I**

been awarded for Phase I of the East Branch Extension.

In February 1999, a contract was awarded for pipeline Reaches 1 and 2, which start at Mill Creek in San Bernardino County and extend through the cities of Yucaipa and Calimesa to Garden Air Creek in Riverside County. Construction began with the issuance of a Notice to Begin Work on February 26, 1999. Fabrication of a 54-inch-diameter steel pipe started on May 26, 1999. A total of 1,100 sections will be required for this pipeline. As of December 31, 1999, more than 800 pipeline sections were being fabricated.

Work started in March 1999 on a contract to furnish power circuit breakers and switchyard equipment for Greenspot and Crafton Hills Pump Stations; a second contract to furnish power transformers for these facilities began in May 1999.

Work started in October 1999 on a contract to design, manufacture, test, and deliver switchgear for Greenspot and Crafton Hills Pump Stations. Three other contracts to furnish valves for the project were also awarded in October.

A contract to design, manufacture, test, and deliver turbine pumps for Greenspot, Crafton Hills and Cherry Valley Pump Stations began in November 1999.

Financing. The balance of the project costs will be financed, as needed, through the sale of short-term commercial paper notes and SWP revenue bonds.

Environmental Mitigation. An extensive environmental mitigation plan for the project addressed the fact that the pipeline crosses habitat associated with two sensitive species—Plummer’s mariposa lily and the coastal California gnat-catcher—although neither species has been documented in the area.

Delta Resources and Environmental Issues

The 738,000-acre Delta is the heart of California’s water environment. The Delta, at the convergence

of the Sacramento and San Joaquin Rivers, is a network of islands, sloughs, marshes, and reclaimed farmland that stretches from Sacramento to San Francisco Bay. A source of drinking water for about two-thirds of California’s population, the Delta also provides irrigation for the Central Valley, which produces 55 percent of the country’s fruits and vegetables.

Human activities, such as land development, water use, wastewater discharges, and introduced species, have caused water quality and environmental problems in the Delta, as evidenced by population declines in many of its biological species.

The State Water Resources Control Board has adopted water quality control plans and policies to protect the Delta’s water quality and environment and to control its water resources.

Bay-Delta Water Right Hearings

On December 15, 1994, federal and State officials and key stakeholder groups agreed on a protection plan for the Bay-Delta Estuary entitled the *Principles for Agreement*. At the same time, SWRCB issued a draft Water Quality Control Plan consistent with the Principles for Agreement.

On February 28, 1995, USBR and the Department filed a petition with SWRCB to change their water rights to conform to the Principles for Agreement and draft Plan. Their petition asked that USBR and the Department be allowed to divert or redivert water from each others’ points of diversion in the southern Delta.

After revising its draft Plan in response to public comments, SWRCB adopted the *Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* on May 22, 1995.

Bay-Delta Water Right Hearing. SWRCB addressed implementation of the 1995 Bay-Delta Plan through a water right hearing process staged in eight phases. During the hearings, held from July 1, 1998, through December 31, 1999, SWRCB heard 80 days of testimony and concluded phases 1 through 7 of the hearing process.

On December 29, 1999, SWRCB certified both the *Final Environmental Impact Report for Implementation of the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* and the *Final Environmental Impact Report for Consolidated and Conformed Place of Use*. Approval of these EIRs signified implementation of the 1995 Bay-Delta Plan and approval of the Department and USBR's request to be allowed to divert or redivert water from each others' points of diversion in the southern Delta.

Decision 1641. On December 29, 1999, SWRCB adopted Decision 1641. D-1641 addressed objectives to protect water quality and flow in the Delta. Under D-1641, the Department and USBR continue to be responsible for meeting water quality objectives for Delta outflow until the adoption of a new decision. The San Joaquin River Agreement/ Vernalis Adaptive Management Plan was established to measure the effects of flow and exports on San Joaquin fall-run chinook salmon.

Phase 8 of the Bay-Delta Water Right Hearings, the final allocation of responsibility for meeting Delta outflow objectives, will be considered by SWRCB in 2000 or early 2001.

CALFED Bay-Delta Program

The CALFED Bay-Delta Program is a cooperative effort among State and federal agencies and California's environmental, urban, and agricultural communities. CALFED was started in 1995 to address environmental and water management problems associated with the Bay-Delta system, the intricate web of waterways created at the junction of the San Francisco Bay and the San Joaquin River system and the watershed that feeds them.

CALFED released the *Draft Programmatic Environmental Impact Statement/Environmental Impact Report for the Bay-Delta Program* on June 25, 1999, followed by a 90-day public comment period that ended September 23, 1999.

The Draft EIS/EIR is the result of 4 years of unprecedented collaboration among State and federal agencies and stakeholders that offers improvements to water suppliers, agriculture, business, and the envi-

ronment. Following the public hearings, public comments were processed and refinements made to the draft program plan. A Final EIS/EIR is expected in June 2000. The plan proposes strategies to improve four interrelated Delta problem areas: ecosystem health, water quality, levee system integrity, and water supply reliability. The plan is expected to take 30 years to enact and cost in excess of \$10 billion.

Integrated Storage Investigation. CALFED started the Integrated Storage Investigation in 1999 as part of its ongoing evaluation of the appropriate role of storage alternatives. The development and construction of new groundwater and/or surface storage will be linked with aggressive implementation of water conservation, recycling, and a protective water transfer market. Through ISI, CALFED will evaluate and determine the appropriate mix of surface water and groundwater storage; identify acceptable projects; and initiate permitting and construction, if program linkages and conditions are satisfied. ISI conclusions will be used to develop an integrated water management strategy that CALFED can implement. The Office of State Water Project Planning and the Division of Planning and Local Assistance are assisting CALFED with ISI.

In 1999, ISI began work on the In-Delta and Off-Aqueduct Storage Study to evaluate the value of connecting in-Delta storage facilities with south Delta export facilities. This study, coordinated by OSWPP, started evaluating five reservoir sites, which include storage areas in the Delta and reservoirs adjacent to the State and federal aqueducts south of the Delta.

South Delta Improvements Program

As part of the Interim South Delta Program, the Department pursued the construction of south Delta facilities to improve Delta water conditions while the CALFED Bay-Delta Program developed its long-term solution. The Department released a Draft Environmental Impact Statement/Environmental Impact Report for ISDP in July 1996; however, a Final EIS/EIR was never produced.

In 1999, CALFED decided that south Delta facilities should be included as a component of CALFED; subsequently, the program was renamed the South Delta Improvements Program. The new purpose for SDIP

was to improve the reliability of existing SWP south Delta facilities and operations; ensure that water of adequate quantity and quality was available for diversion within the South Delta Water Agency's service area; and help restore ecological health in the lower San Joaquin River and south Delta.

Preferred Plan. A preferred plan for SDIP was formulated, including such items as three flow-control structures to improve local water levels and circulation in south Delta channels; a fish-control structure to improve fish migration in the San Joaquin River; approximately 5 miles of dredging in existing south Delta channels; and an additional intake to Clifton Court Forebay.

Environmental Review. Staff worked in 1999 on a Draft EIS/EIR for the SDIP. The Draft EIS/EIR is scheduled for release in early 2001 and a Final EIR/EIS is scheduled for release in late 2002.

Status of Threatened Listings

Steelhead Trout. The National Marine Fisheries Service listed Central Valley steelhead trout as threatened under the Federal Endangered Species Act in March 1998, but still had not adopted a 4(d) rule as of December 31, 1999. The 4(d) rule determines if and when NMFS needs to authorize the incidental take of the fish.

Chinook Salmon. NMFS listed Sacramento River spring-run chinook salmon as threatened under FESA in 1999 and determined that the Central Valley fall-run/late fall-run chinook salmon did not warrant listing, but remains a candidate species.

Splittail. U.S. Fish and Wildlife Service listed the Sacramento splittail as a threatened species under FESA. Sacramento splittail, a large minnow native to the Sacramento-San Joaquin Estuary, had been considered for listing since 1994.

Consultation on Listed Species. The Department and USBR consulted with NMFS and DFG about the potential impact of SWP and CVP operations on steelhead and spring-run chinook salmon. A 1-year biological opinion and take authorization for these species was developed in 1999. The Department and USBR, through the CALFED Operations Group,

continued the Spring-Run Salmon Protection Plan to provide greater and more immediate protection for the species during fall 1999.

The Department and USBR also resumed consultation with USFWS to develop a splittail incidental take statement for operation of the SWP and CVP.

Mitten Crabs

An introduced species, the Chinese mitten crab created severe problems in 1998 for the fish salvage operation of the SWP and CVP, with nearly 25,000 crabs invading the Tracy Pumping Plant every day in early fall and about 10,000 entering the Skinner Fish Facility daily by October 1998.

To prevent these crabs from impacting the fish salvage operation in 1999, Department and USBR staff designed, built, and installed devices to deter the crabs. Department staff installed an underwater barrier near the Skinner Fish Facility to guide crabs crawling along the bottom into collection traps. USBR staff installed a travelling water screen near the Tracy Pumping Plant.

Only around 30,000 crabs were collected at Skinner Fish Facility in all of October 1999, indicating that the installed devices were effective in protecting SWP fish salvage operations. In addition, mitten crabs appeared at State and federal fish facilities in much smaller numbers than expected in fall 1999.

Power Resources

In 1999, SWP pumping plants consumed 5.76 billion kWh and power plants generated 5.67 billion kWh of energy. The Department sold 4.23 billion kWh of energy in 1999 to 27 utilities and 13 power marketers for total revenues of \$104.15 million. The Department also received \$22.36 million in revenues for capacity, exchanges, transmission arrangements, and ancillary services. The combined revenue was \$126.5 million. The sidebar below documents 1999 SWP power generation and consumption.

Oroville Facilities Relicensing

The existing 50-year hydroelectric license for the Oroville facilities will expire January 31, 2007. To obtain a new license, the Department must submit an

application to the Federal Energy Regulatory Commission by January 31, 2005. Because of intense public interest in the relicensing processes, applicants for large projects typically start preparing 8 to 10 years before their existing license expires.

In April 1998, the Department formed the Oroville Relicensing Steering Committee to guide staff through the relicensing process. In 1998 this committee, composed of selected Department managers and supervisors, made recommendations on policy issues, consultant roles, FERC licensing procedures, and formation of a Department relicensing team.

In 1999, the committee recommended that the Department use FERC's Alternative Licensing Procedures, which encourage a collaborative stakeholder approach. FERC offers three relicensing procedures—traditional, hybrid, and alternative. The traditional process involves minimal FERC involvement, while the alternative procedures allow for more FERC involvement and stakeholder interaction.

Deregulation of Electric Utilities

The Department continued its role as a stakeholder and Scheduling Coordinator for the California Independent System Operator in 1999.

Power and transmission are crucial to SWP operations. The SWP is the largest single power consumer and the largest user of transmission capacity in Cali-

fornia. SWP power plants generate a large portion of the energy needed to move water within the State. The Department meets its remaining power needs by purchasing energy or making energy exchanges with other utilities. Power generated and used by SWP plants is conveyed over transmission lines. Consequently, the Department must also pay for transmission.

As a Scheduling Coordinator for ISO, the Department continued to sell spinning, nonspinning, and replacement reserves to ISO. The Department bid pump loads into nonspinning reserves to provide ISO more resources in case of system emergencies or contingencies. The Department also bought and sold energy not purchased or sold through bilateral agreements in the California Power Exchange's day-ahead market.

In 1999, the Department participated in stakeholder forums to address major issues surrounding deregulation, including development of ISO's transmission access charge and off-peak rates; converting existing transmission contracts to ISO service; unbundling ISO's grid management charge; redesigning the ancillary services markets; revising reliability must-run contracts; developing a firm transmission rights auction to purchase firm transmission capacity; creating a new congestion zone to address congestion within Path 26; and other issues of concern.

State Water Project Power Generation and Consumption in 1999

Power Generation and Consumption	Millions of Kilowatt Hours
Energy generation by SWP facilities	5,674
Energy purchased under long-term agreements	3,085
Short-term energy purchases	1,231
Total energy available to the SWP	9,989
Energy sales	(4,231)
Net power consumption of the SWP	5,758

The Safe Drinking Water, Clean Water, Watershed Protection, and Flood Protection Act

The Legislature passed Assembly Bill 1584, the Safe Drinking Water, Clean Water, Watershed Protection, and Flood Protection Bond Act, and the Governor signed the bill in 1999. The Act, if approved by California voters, will authorize the issuance of bonds in the amount of \$1.97 billion for: (1) Safe Drinking Water Program; (2) Flood Protection; (3) Watershed Protection Program; (4) Clean Water and Water Recycling Account; (5) Water Conservation Program (Clean Water and Water Recycling Account); (5) Water Conservation Programs; and (6) Water Supply, Reliability, and Infrastructure Programs.

This bond measure will be placed on the March 7, 2000, ballot as Proposition 13.

Arroyo Pasajero

The Arroyo Pasajero and its tributaries drain approximately 530 square miles of the mountainous terrain west of the California Aqueduct in Fresno County. During periods of heavy rainfall, high flows in the Arroyo Pasajero and its tributaries transport heavy sediment loads from the mountains toward the California Aqueduct, which traverses the Arroyo's alluvial fan and forms a barrier to Arroyo flood flows. Flood control facilities include a detention basin designed to store storm runoff and sediment upstream of the Aqueduct, a siphon to release floodwaters east of the Aqueduct, and drain inlets to release floodwaters into the Aqueduct.

Long-Term Programs. In 1990, the Department sought the assistance of the U.S. Army Corps of Engineers to identify long-term solutions to the Arroyo Pasajero flooding and sediment problems. The Arroyo Pasajero Feasibility Report—started in 1994 as a joint effort among the Corps, the Department, and USBR—provides a rigorous analysis of the flooding and sedimentation problems and evaluates potential solutions. The study is ongoing, with a projected cost of \$7.86 million.

A Draft Feasibility Report and associated Environmental Impact Statement/Environmental Impact Report were released to the public in March 1999. A public meeting on the document was held in April 1999. Two candidate plans demonstrating a federal interest were presented, including

- the enlarged Westside Detention Basin as the Corps' national economic development plan, at an estimated cost of \$238 million and benefit-to-cost ratio of 1.7:1; and
- the Pasajero Gap Detention Dam as a possible locally preferred plan, at an estimated cost of \$225 million and a benefit-to-cost ratio of 1.2:1.

Compelling comments opposing both candidate plans were received from the public and from agencies. The enlarged Westside Detention Basin alternative was criticized for discharging floodwater taken across the Aqueduct to a location inconsistent with recent historical pre-Aqueduct flooding patterns and was determined to be an unacceptable solution. USFWS and DFG deemed that the adverse impacts to listed species in the vicinity of the Pasajero Gap Dam could not be mitigated. Consequently, the Gap Dam plan was also determined to be unacceptable.

The investigation then focused on different alternatives. With this new direction in the investigations, federal authorization for a new project is not expected prior to a possible Water Resources Development Act in 2002.

Business Systems Update

System Application Products

The Department began planning for the implementation of the SAP Enterprise Resources Planning system in August 1998. On July 1, 1999, the Department implemented Phase I of the SAP system.

Phase I focused on the automation and integration of budgeting, purchasing, inventory, fixed assets time capture, position tracking, and cash management activities. The \$18 million Phase 1 project included

hardware, software, and implementation by Deloitte & Touche Consulting Group.

The Department also began planning for Phase 2, which will include maintenance management and SWP operations functionality.

Y2K Update

By July 1999, the Department was ready for Year 2000. All critical systems, including the SWP, California Data Exchange Center, and fiscal systems, were remedied and tested, with contingency plans in place. The Department's Y2K plans were audited by two consultant firms working for the Department of Information Technology, whose auditors stated that the Department was, at that point, the best prepared agency in State government.

Joint contingency plans were developed with the State Water Contractors, and the Department also worked with other water industry organizations to ensure that deliveries of the State's water supply were not interrupted.

Community Service

In addition to water supply, the Department provided education and outreach, recreation opportunities on

the SWP, and local assistance to users of the SWP. The Department also managed several programs—including the Water Use Efficiency Program, Agricultural Drainage Program, and Environmental Impact Document Review—that benefited local agencies and the 29 long-term water contractors.

Silverwood Lake Bass Fisheries

The Department, working with DFG and the Bass Council, implemented a plan to revitalize the bass fishery at Silverwood Lake in northern San Bernardino County, including stocking the lake with about 3,500 Florida strain largemouth bass.

Special Publications

The *California State Water Project Atlas*, a new publication of SWP facilities with photographs and statistics, was published in 1999 and distributed to the State Water Contractors, major water organizations, and State legislators.

Chapter 1
The State Water Project

Aerial view of Thermalito Pumping-Generating Plant

California's diverse geography contains both the highest and lowest elevations in the coterminous United States, with a resulting diversity of climate that ranges from desert to alpine to subtropical. In a typical year, some areas receive as little as 2 inches of rain, while others receive more than 100. This diversity of geography and climate creates an intricate and constantly changing pattern of water supplies, which, in turn, creates enormous challenges in managing this vital resource.

Like present-day Californians, the earliest settlers faced the problem of how best to conserve, control, and deliver water. Remains of aqueducts, canals, and dams are still found near some of California's original missions. The first recorded aqueduct was 6 miles long; it was built in 1770 to serve the San Diego mission. In the early twentieth century, several cities—San Francisco and Los Angeles among them—built aqueducts to convey water from the Sierra Nevada to other parts of the State.

In 1951, after many years of discussion and study, the Legislature authorized construction of a water storage and supply system to capture and store runoff in Northern California and deliver it to areas of need throughout the State. Eight years later, the Legislature passed the Burns-Porter Act, which provided the mechanism for obtaining funds necessary to construct the initial facilities. In 1960, California voters approved an issue of \$1.75 billion in general obligation bonds, as authorized in the act, thereby obtaining funds to build the State Water Project. In 1962, the first water was delivered through a portion of the South Bay Aqueduct to two long-term contracting agencies in Alameda County.

Today the SWP, managed by the Department of Water Resources, is the largest state-built, multi-purpose water project in the country. The SWP was designed and built to deliver water, control floods, generate power, provide recreational opportunities, and enhance habitats for fish and wildlife. About 22 million of California's estimated 33 million residents benefit from SWP water; it irrigates about 600,000

acres of farmland, mainly in the south San Joaquin Valley.

Precipitation and Runoff

The water stored and delivered by the SWP originates from rainfall and snowmelt runoff in Northern and Central California's watersheds, where most of the State's precipitation occurs.

Since 1968, the Department has monitored and recorded annual precipitation and runoff, because precipitation, snowpack, and the rate and amount of snowmelt help determine how much water the SWP can deliver in any given year. The water year as designated by the Department is October 1 through September 30.

Water Delivery Facilities

The SWP depends on a complex system of dams, reservoirs, power plants, pumping plants, canals, and aqueducts to deliver water. Although initial transportation facilities were essentially completed in 1973, other facilities have since been built, and still others are either under construction or are planned to be built as needed (Figure 1-1). The SWP facilities include 28 dams and reservoirs, 26 pumping and generating plants, and approximately 660 miles of aqueducts.

Existing long-term SWP water supply contracts call for the annual delivery of 4,086,021 acre-feet of entitlement water by 1998 through SWP facilities,

Figure 1-1
Names and Locations of Primary Water Delivery Facilities
Current and Projected, December 31, 1999

gradually increasing to a maximum of 4,172,686 acre-feet by 2020. However, because of changes that have occurred since the long-term water contracts were signed in the 1960s, actual demand has not developed as projected. These changes include population growth variations, differences in local use, local water conservation programs, and conjunctive-use programs. The SWP delivered 2,391,985 acre-feet of entitlement water to long-term water contractors' service areas in 1999. Nevertheless, demands for SWP water are expected to increase as the population of California continues to increase.

Project Design

Water from rainfall and snowmelt runoff is stored in SWP conservation facilities and delivered via SWP transportation facilities to water agencies and districts in Southern California, Central Coastal, San Joaquin Valley, South Bay, North Bay, and Upper Feather River areas.

Three small reservoirs—Lake Davis, Frenchman Lake, and Antelope Lake—are the northernmost SWP facilities. Situated on Feather River tributaries in Plumas County, these lakes are used primarily for recreation; they also provide water to the City of Portola and local agencies that have water rights agreements with the Department.

Downstream from these three lakes is Lake Oroville, the keystone of the SWP. Lake Oroville conserves water from the Feather River watershed. Created by Oroville Dam, the tallest earthfill dam in the Western Hemisphere, Lake Oroville is the project's largest storage facility, with a capacity of about 3.5 million acre-feet (an acre-foot is about 326,000 gallons).

Releases from Lake Oroville flow down the Feather River into the Sacramento River, which drains the northern portion of California's great Central Valley. The Sacramento River flows into the Sacramento-San Joaquin Delta—738,000 acres of land interlaced with channels that receive runoff from 40 percent of the State's land area. The SWP, along with the federal

Central Valley Project and local agencies, diverts water from the Delta.

From the northern Delta, Barker Slough Pumping Plant diverts water for delivery to Napa and Solano Counties through the North Bay Aqueduct, completed in 1988. Near Byron, in the southern Delta, the SWP diverts water into Clifton Court Forebay for delivery south of the Delta. Banks Pumping Plant lifts water from Clifton Court Forebay into Bethany Reservoir; from Bethany Reservoir, the South Bay Pumping Plant lifts water into the South Bay Aqueduct to supply Alameda and Santa Clara Counties. The South Bay Aqueduct provided initial deliveries in 1962 and has been fully operational since 1965.

Most of the water delivered to Bethany Reservoir from Banks Pumping Plant flows into the California Aqueduct. This 444-mile-long main aqueduct conveys water to the primarily agricultural lands of the San Joaquin Valley and the mainly urban regions of Southern California.

The California Aqueduct winds along the west side of the San Joaquin Valley. It transports water to O'Neill Forebay, Gianelli Pumping-Generating Plant, and San Luis Reservoir. San Luis Reservoir has a storage capacity of more than 2 million acre-feet and is jointly owned by the Department and the U.S. Bureau of Reclamation. The Department's share of gross storage in the reservoir is about 1,062,000 acre-feet. Generally, water is pumped into San Luis Reservoir during late fall through early spring, and is temporarily stored for release back to the California Aqueduct to meet summertime peaking demands of SWP and CVP contractors.

SWP water not stored in San Luis Reservoir, and water eventually released from San Luis, continues to flow south through the San Luis Canal, a portion of the California Aqueduct jointly owned by the Department and USBR.

As the water flows through the San Joaquin Valley, numerous turnouts convey the water to farmlands within the service areas of the SWP and CVP. Along its journey, the water is lifted more than 1,000 feet by

four pumping plants—Dos Amigos, Buena Vista, Teerink, and Chrisman—before reaching the foot of the Tehachapi Mountains.

In the San Joaquin Valley near Kettleman City, Phase I of the Coastal Branch Aqueduct serves agricultural areas west of the California Aqueduct. This branch was extended in Phase II to serve municipal and industrial water users in San Luis Obispo and Santa Barbara Counties, beginning in August 1997.

The remaining water conveyed by the California Aqueduct is delivered to Southern California, home to about two-thirds of California's population. Before this water can be delivered, it must first cross the Tehachapi Mountains. Pumps at Edmonston Pumping Plant, situated at the foot of the mountains, raise the water 1,926 feet—the highest single lift of any pumping plant in the world. Then the water enters 8.5 miles of tunnels and siphons as it flows into Antelope Valley, where the California Aqueduct divides into two branches: the East Branch and the West Branch.

The East Branch carries water through Antelope Valley into Silverwood Lake in the San Bernardino Mountains. From Silverwood Lake, water flows through the San Bernardino Tunnel into Devil Canyon Power Plant. Water continues down the East Branch to Lake Perris, the southernmost SWP reservoir.

The East Branch Extension, Phases I and II, will carry water from Devil Canyon Power Plant Afterbay to Cherry Valley, bringing water to Yucaipa, Calimesa, Beaumont, Banning, and other communities. When completed, the East Branch Extension will be a nearly 33-mile pipeline linking parts of service areas for San Bernardino Valley Municipal Water District and San Geronio Pass Water Agency to the California Aqueduct. Phase I is planned for completion in 2001; planning for Phase II is underway.

Water in the West Branch flows through Warner Power Plant into Pyramid Lake in Los Angeles

County. From there it flows through the Angeles Tunnel, Castaic Power Plant, Elderberry Forebay and Castaic Lake, terminus of the West Branch. Castaic Power Plant is operated by the Los Angeles Department of Water and Power.

The energy needed to operate the SWP, the single largest user of electrical power in California, comes from a combination of its own hydroelectric and coal-fired generation plants and power purchased from other utilities. The coal-fired plant and the project's eight hydroelectric power plants, including three pumping-generating plants, produce enough electricity in a normal year to supply about two-thirds of the necessary operating power.

Tables 1-1 through 1-5 present statistical information about primary reservoirs, primary dams, pumping plants, power plants, and aqueducts. Additional information regarding operation of the plants under full development can be found in Chapter 10.

Additional Construction

SWP aqueduct facilities were initially designed and constructed to provide service to all agencies to meet their water delivery needs up to 1990. Project water conservation reservoirs were planned to be constructed in stages as water demands increased. Oroville and San Luis were the first SWP conservation reservoir facilities constructed. Additional SWP facilities were scheduled to meet increased demands. It was anticipated that population growth in delivery service areas and water supply areas of origin would influence the final schedule for the additional SWP facilities. However, increased costs, environmental issues, and increased non-SWP demands for limited water supplies delayed the construction schedule for some of the planned additional facilities.

In response to changes in water management policy, the Department continues to reassess plans for the additional facilities that will incorporate increased environmental safeguards while also increasing the SWP delivery yield. Developing these plans involves the time-consuming process of finding technically suitable projects and satisfying the many complex and dynamic environmental procedures, laws, and regulations.

In the mid-1980s, the Department began planning an offstream storage complex, Los Banos Grandes, in Merced County. Initial plans for Los Banos Grandes were completed, but additional planning has been suspended until environmental concerns have been addressed. The Department also developed alternative methods of storing water, including the Kern Water Bank, a conjunctive-use groundwater storage facility located in Kern County.

The signing of the Monterey Agreement in December 1994 set the principles for permanently transferring the State-owned Kern Fan Element of the Kern Water Bank from the Department to two agricultural contractors, Kern County Water Agency and Dudley

Ridge Water District. The transfer occurred August 9, 1996.

The Department continues to plan, design, and construct transportation and power-producing facilities for the SWP. Mojave Siphon Power Plant was completed in 1996. The enlarged Devil Canyon Power Plant and the new Devil Canyon Power Plant Second Afterbay became operational in 1995. Phase II of the Coastal Branch of the California Aqueduct began operation in August 1997. The Coastal Branch can transport about 50,000 acre-feet of water annually to San Luis Obispo and Santa Barbara Counties.

Methods of Financing

Project facilities have been constructed with several general types of financing: general obligation bonds and tideland oil revenues (under the Burns-Porter Act, which was approved by the Legislature in 1959, and the bond issue approved by voters in 1960); revenue bonds; and capital resources revenues. Repayment of these funds and the operations, maintenance, power, and replacement costs associated with water supply are paid by the 29 agencies and districts that have long-term contracts with the Department for SWP water; costs are repaid as they are incurred.

The contracts initially provided for a combined maximum annual entitlement of 4,230,000 acre-feet of water supply. As a result of contract amendments in the 1980s and the Monterey Amendment, the current combined maximum annual entitlement totals 4,172,686 acre-feet. The contracts are in effect for the longest of the following periods:

- the project repayment period, which extends to the year 2035;
- 75 years from the date of the contract; or
- the period ending with the latest maturity date of any bond used to finance the construction costs of project facilities.

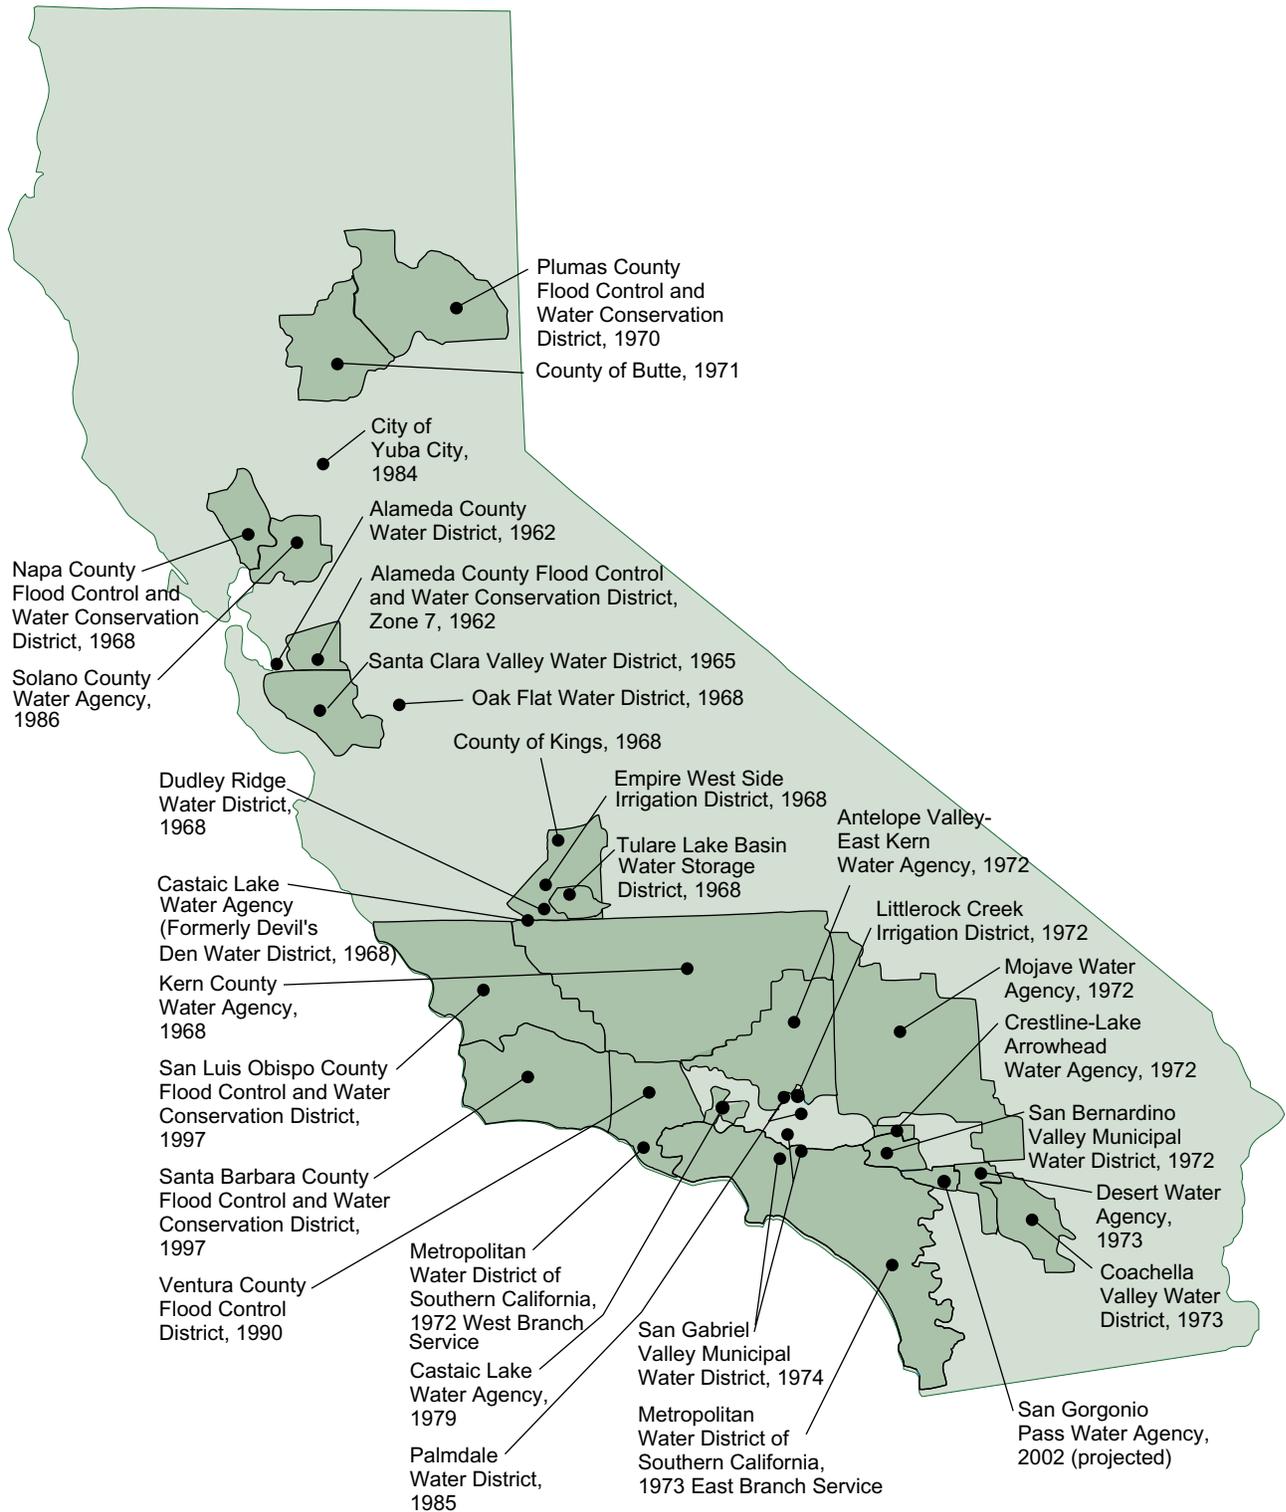

Long-Term Contracting Agencies

From 1963 through 1967, 32 agencies or districts signed long-term water supply contracts with the Department. However, in 1965, the City of West Covina was annexed to the Metropolitan Water District of Southern California, and in 1981 Hacienda Water District was assigned to Tulare Lake Basin Water Storage District. On January 1, 1992, Castaic Lake Water Agency assumed all rights and

obligations granted to Devil's Den Water District according to its long-term water supply contract. The 29 agencies and districts that now have long-term contracts with the Department as of December 31, 1999, are listed in Figure 1-2 and Table 1-6.

Figure 1-2 shows the name and location of each contracting agency and district and lists the first year of SWP delivery service for each. Table 1-6 presents information about each contracting agency.

**Figure 1-2

^a All water delivered to long-term SWP contractors, including carryover entitlement, Article 21, surplus, unscheduled, exchange, permit, purchased, local, and non-SWP water.

^b Statutes of 1978, Chapter 1207, added Section 135 to the Revenue and Taxation Code, requiring assessment at 100 percent of full value for the 1981-82 fiscal year and fiscal years thereafter.

^c Total of all Plumas County Flood Control and Water Conservation District, including Last Chance Creek Water District.

^d Assessed valuation not available on an agency area breakdown.

^e District includes land in the San Joaquin Valley Area formerly known as Devil's Den Water District.

^f Total for MWD, including Calleguas Municipal Water District, which is common to MWD and Ventura County Flood Control District.

^g Includes duplicate values. Some areas that are within two or more agencies are included in each agency's total.

Chapter 2

Delta Resources

Channel east of Woodward on Middle
River in the Sacramento Delta

Significant Events

- Temporary barriers were installed during 1999, including the Grant Line Canal barrier, which was installed and operated for the third time in the history of the Temporary Barriers Project.
- A preferred plan for South Delta Improvement Program is being formulated as part of the ongoing process of preparing project-specific environmental documentation.

Over the past 40 years many programs were developed and implemented by federal and State agencies, including the Department of Water Resources, to manage the Sacramento-San Joaquin Delta as both a unique environmental resource and as one of California's major water supply sources.

The common goals of these programs have been to

- improve water supply reliability to the State Water Project, Central Valley Project, and Delta water users;
- determine levels of flow and salinity necessary to protect fish and wildlife habitat; and
- devise methods to control flooding, protect fish and wildlife, and provide recreational activities.

Delta Water Management Programs

Over the last decade or so, the Department's planning programs focused on solving water management problems in three distinct areas of the Sacramento-San Joaquin Delta: the north Delta, west Delta, and south Delta (Figure 2-1). However, the listing of several Bay-Delta fish species under the Endangered Species Act resulted in additional operational restrictions on the SWP, which caused considerable uncertainty as to the benefits the SWP would obtain as a result of implementing these programs. Further complicating this issue were the promulgation of new Delta standards by the federal Environmental Protection Agency and the implementation of 800,000 acre-feet of Central Valley Project yield for fish and wildlife protection under the 1992 Central Valley Project Improvement Act.

In June 1994, a Framework Agreement between federal and State governments defined a joint federal-State cooperative process for developing a long-term solution to the water supply, water quality, and ecosystem problems of the Delta. The CALFED Bay-Delta Program was formed to develop the long-term Delta "solution." The program includes extensive public outreach and input.

South Delta Improvements Program

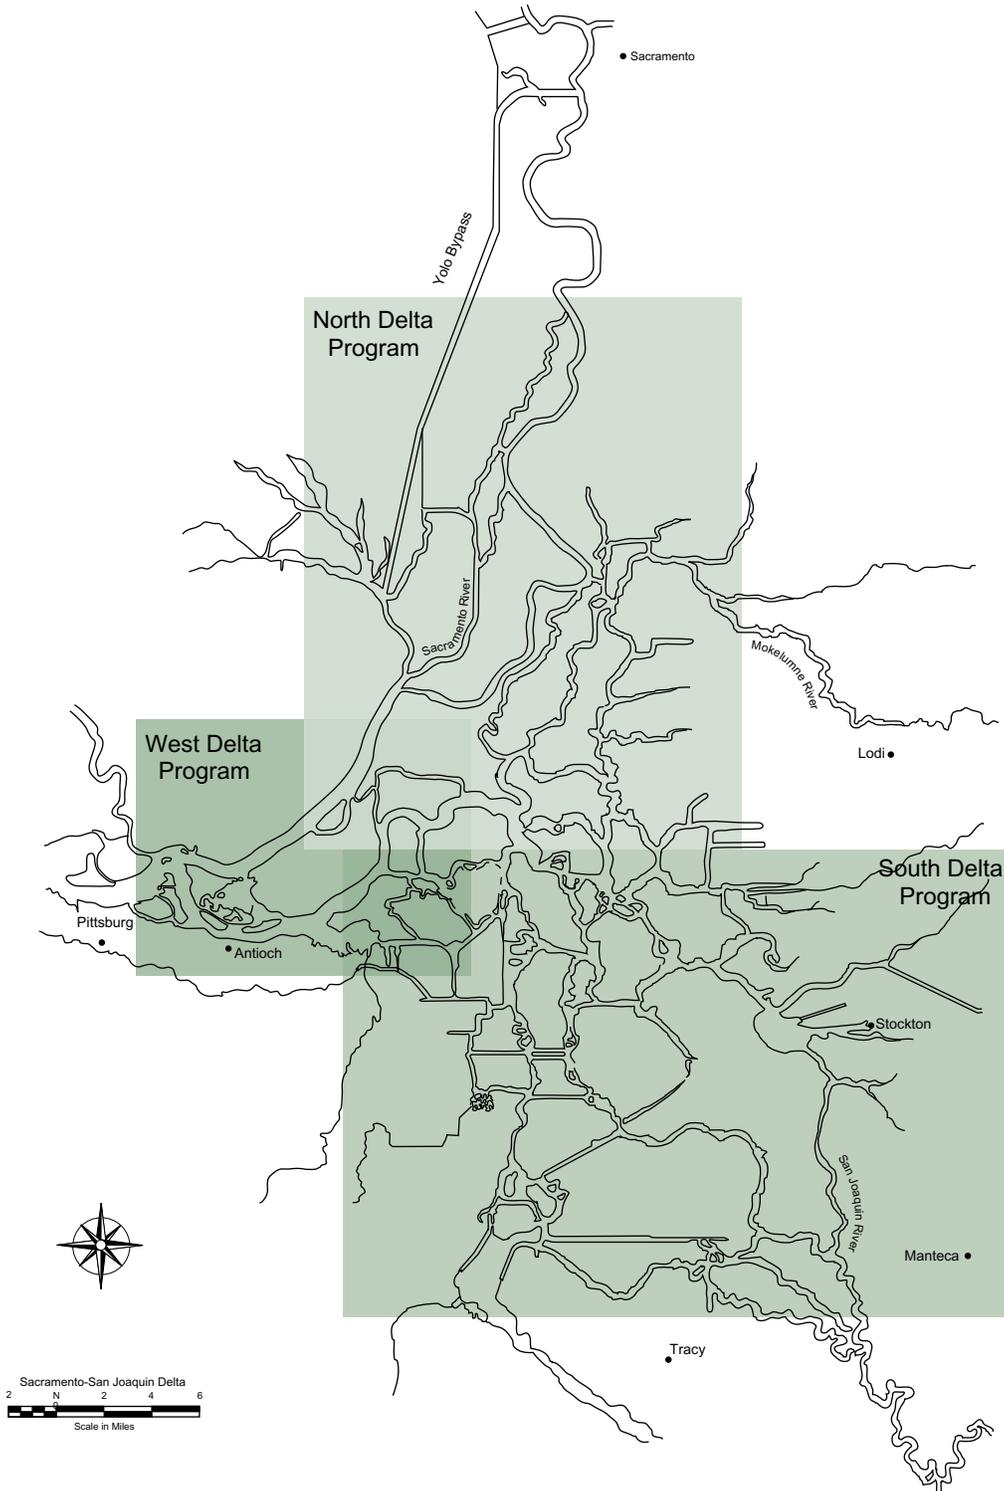

During the late 1990s, the Department pursued the accelerated construction of south Delta facilities to improve Delta water conditions (the Interim South Delta Program) while awaiting the independent development of the CALFED Bay-Delta Program's long-term solution. The Department released a Draft EIS/EIR for ISDP in July 1996; however, a Final EIS/EIR was never produced. In 1999, the CALFED Bay-Delta Program decided that south Delta facilities would be included as a key component of the CALFED decision-making process. Subsequently, the program was renamed the South Delta Improvements Program. The purpose of SDIP has been slightly revised from that of the former ISDP. The new purpose for SDIP is to

- improve the reliability of existing SWP facilities;
- ensure that water of adequate quantity and quality is available for diversion to the South Delta Water Agency's service area for beneficial use; and
- reduce the effects of SWP exports on both aquatic resources and direct losses of fish in the south Delta.

Preferred Plan. A preferred plan for SDIP is being formulated as part of the ongoing process of preparing project-specific environmental documentation. It is likely to consist of

- three flow-control structures to improve local water levels and circulation in south Delta channels;
- a fish-control structure to improve fish migration in the San Joaquin River;

Figure 2-1
Boundaries of North, West, and South Delta Water Management Programs

- approximately 5 miles of dredging in existing south Delta channels to improve conveyance and circulation;
- additional site-specific dredging in the south Delta;
- modifications to existing agricultural diversion intakes;
- an additional intake to Clifton Court Forebay north of the existing intake;
- fish screening and salvage facilities at the new northern intake that will replace the existing Skinner Fish Facility; and
- increasing the maximum allowable diversions into Clifton Court Forebay.

Increasing diversions into Clifton Court Forebay, subject to receiving a U.S. Army Corps of Engineers permit, would allow Banks Pumping Plant to pump up to its maximum design capacity of 10,300 cubic feet per second with fewer restrictions. It would also improve the reliability of SWP water supply and increase operational flexibility. In addition, the proposal to construct flow-control structures in south Delta channels would allow the Department and U.S. Bureau of Reclamation to improve conditions for local agricultural diverters in the south Delta who divert water in the vicinity of the project export facilities. The fish-control structure would benefit both spring and fall salmon migrations in the San Joaquin River.

Environmental Review Process. A Draft EIS/EIR for the SDIP is scheduled for release in early 2001 and a Final EIR/EIS is scheduled for release in late 2002. Once the Final EIR/EIS is completed, a notice of determination and record of decision will be filed. State and federal regulatory agencies may then act on permits required to construct and operate the proposed facilities.

The necessary permits would be issued by the Corps according to both Section 404 of the Federal Water Pollution Control Act (Clean Water Act) for dredging operations and Section 10 of the Rivers and Harbors Act for Navigation. Approval for the permits must be coordinated with the U.S. Fish and Wildlife Service, National Marine Fisheries Service, the Environmental Protection Agency, and the Department of Fish and Game.

Clean Water Act

Section 404 of the Federal Water Pollution Control Act (Title 33, United States Code Section 1344 [1977]), also known as the Clean Water Act, requires that a permit be obtained from the U.S. Army Corps of Engineers for any activity that results in discharge of dredged material or placement of fill material in the waters of the United States. Section 404 has been broadly interpreted by the federal courts to include structures or fills introduced into waters within a state that may be used for interstate or foreign commerce. Section 402 of the Clean Water Act established a permit system known as the National Pollutant Discharge Elimination System to regulate point sources of discharges in navigable waters of the United States.

The Porter-Cologne Water Quality Control Act is California's comprehensive water quality control law and is a complete regulatory program designed to protect water quality and beneficial uses of the State's water. In 1972, the Porter-Cologne Act was amended to give California the authority and ability to operate the NPDES permits program. These laws require regional water quality plans to be adopted and implemented by issuing waste discharge requirements to each discharger of waste that could impact the waters of the State.

Temporary Barriers Project. The Department has installed and operated temporary barrier facilities in the south Delta since 1990 to improve south Delta conditions and collect data to design and operate permanent barrier facilities, as proposed in the SDIP.

In addition, biological monitoring programs have been conducted to

- determine potential effects of barriers on Delta fish and vegetation;
- evaluate and review computer model calibration; and
- develop comprehensive environmental information for the design and operation of permanent barrier facilities.

Temporary rock barriers are installed on an annual basis, during low flow conditions, at four sites:

- Old River at Head, in Old River where it splits from the San Joaquin River;

- Old River near Tracy, in Old River one-half mile east of the Tracy Pumping Plant intake and about 8 miles northwest of the City of Tracy;
- Middle River, just south of the confluence of Middle River, Trapper Slough, and North Canal; and
- Grant Line Canal, 420 feet east of the Tracy Boulevard Bridge.

The barrier at the Head of Old River prevents San Joaquin River flow from entering Old River and flowing toward export facilities. The additional flow in the San Joaquin River helps guide San Joaquin salmon to the ocean in the spring and improves dissolved oxygen levels for upstream salmon migration in the fall. The other barriers have culverts with flap gates that improve water levels and circulation in south Delta channels during the irrigation season.

Since 1963 the Old River at Head barrier has been installed in the fall and intermittently, since 1992, in the spring. High San Joaquin River flows sometimes prevent the Old River at Head barriers from being installed. The Old River barrier near Tracy has also been seasonally installed since 1991, as has the Middle River barrier since 1987, and the Grant Line Canal barrier since 1996.

West Delta Program

The objectives of the West Delta Program are to

- effectively manage SWP-owned lands on Sherman and Twitchell Islands (approximately 12,000 acres in total);
- improve the integrity of local levees;
- implement land-use management to control subsidence and soil erosion on Sherman and Twitchell Islands;
- implement mitigation requirements associated with the Temporary Barriers Program and proposed ISDP; and
- provide diverse habitat for wildlife and waterfowl.

The Department contracted with a consultant to develop preliminary wildlife management plans for Sherman and Twitchell Islands. The plans are designed to benefit species of wildlife that occupy wetland, upland, and riparian habitats and to provide

recreational opportunities for hunting and viewing. In addition, property acquired and potential habitat developed by the Department could mitigate impacts associated with current and future Delta water management programs, including those being proposed by the Department and the CALFED Bay-Delta Program.

The Department is a major landowner on both Twitchell and Sherman Islands and holds two of the three trustees' positions for Reclamation District 1601 (Twitchell Island) and Reclamation District 341 (Sherman Island). This allows the Department to oversee the management and operation of each district with the goal of improving conditions and accountability. The reclamation districts provide levee maintenance, island drainage, and some internal water supply. The districts also assess the landowners for the operational needs of the public districts.

North Delta Program

In 1999, stakeholder meetings were held through the CALFED Bay-Delta Program.

Delta Flood Control Program

The Sacramento-San Joaquin Delta is one of California's most valuable and irreplaceable resources. Without adequate levee protection, the Delta, as we know it today, would be lost. The levees serve many needs: they protect valuable wildlife habitat, farms, homes, urban areas, recreational developments, highways and railroads, natural gas fields, utility lines, major aqueducts, and other public developments. The levees are critical to the protection of Delta water quality and serve a significant function in the State's water transfer system. The State Legislature recognized the importance of the Delta after the floods of the early 1980s and enacted the Delta Flood Protection Act of 1988, (SB 34 [Water Code Sections 12310 *et seq.*, and 12980 *et seq.*]). With SB 34, the Legislature declared that, "...the Delta is endowed with many invaluable and unique resources and that these resources are of major statewide significance."

In SB 34, the Legislature declared its intent to appropriate \$12 million annually through fiscal year 1998-99 for the Delta Flood Protection Fund. Six million dollars of the appropriation are for local

assistance under the Delta Levee Maintenance Subventions Program. The remaining \$6 million are for special Delta flood control projects, including subsidence studies and monitoring on Bethel, Bradford, Jersey, Sherman, and Twitchell Islands; Holland, Hotchkiss, and Webb Tracts; and the towns of Thornton and Walnut Grove.

Currently, the program has received more than \$97 million in appropriated funds and, combined with local funds, has realized \$128 million in levee improvements. Approximately \$12 million of these funds were provided by Proposition 204. In 1996, AB 360 was signed into law. This law expanded the area covered by the Special Projects Program to include the remainder of the legal Delta and the northern Suisun Bay from Van Sickle Island to Montezuma Slough. Delta flood control program staff at the Central District is developing a prioritization process for distributing funds under AB 360. Appropriations for the program run out on June 30, 2000, and a budget proposal has been made for continued funding.

Delta Levee Maintenance Subventions Program

The Subventions Program provides funding, as a reimbursement, to local Delta reclamation districts to assist levee maintenance, repair, and rehabilitation in compliance with the State's Flood Hazard Mitigation Program objectives. Each year, districts wanting to participate in the program prepare work plans and file applications with the State Reclamation Board for funding.

After applications and work plans are reviewed, the Department requests the approval of SRB. SRB also approves each district's maximum possible reimbursement—up to 75 percent for levee work and habitat mitigation—and maximum advanced reimbursement amount based on program reimbursement priorities and available funding.

After SRB approval, agreements are executed between SRB and each participating district. These agreements state that eligible work will be completed during the current fiscal year. All work must be in compliance with appropriate State and federal laws, including the California Environmental Quality Act, the State and federal Endangered Species Acts, Section 1600 of the Fish and Game Code, Section 404 of the Clean Water Act, and approval by DFG that a net long-term habitat improvement of riparian, fisheries, and wildlife habitat will result.

Special Projects

The Special Flood Control Projects Program assists the eight western islands, other locations in the Delta, northern Suisun Bay, and the towns of Thornton and Walnut Grove. In July 1989, the Legislature approved a plan of action for flood control for the towns of Thornton and Walnut Grove.

For the eight western Delta islands, the California Water Commission approved a report of initial or "fast-track" actions in September 1989, and approved the long-term actions and priorities in May 1990. The long-term plans are used by the

Endangered Species Acts

In planning, constructing, and operating the SWP, the Department must consider the effects its actions will have on organisms, plants, birds, reptiles, fish, and mammals listed as threatened or endangered according to the Federal Endangered Species Act (Title 16, United States Code sections 1531-1544 [1973]) and the California Endangered Species Act (California Fish and Game Code sections 2050-2098 [1984]). An endangered species is one in danger of extinction in all or a significant portion of its range; a threatened species is one likely to become endangered. These acts are designed to protect threatened and endangered species by:

- ensuring federal and State agencies adopt measures to protect the species during the design, construction, and operation of projects and in taking other forms of agency action; and
- prohibiting the take of endangered species.

One important aspect of the acts is preserving habitat critical to the survival of the threatened or endangered species.

Department to determine how to best use appropriations to protect these islands and include

- rehabilitation of threatened levees through the use of imported dredged material;
- verification of elevations in the Delta through the use of Global Positioning System equipment; and
- upgrading levees to the standards included in Bulletin 192-82, *Delta Levees Investigation*.

Depending on the ability-to-pay of each reclamation district, the Department pays up to 100 percent of the cost of these activities. Districts receiving funds under the Special Flood Control Projects Program are required to participate in habitat improvement programs to ensure a net long-term habitat improvement.

Delta Levees Habitat Improvement

The Delta Flood Protection Program continues to make significant strides in its efforts to create valuable habitat in the Delta. In 1999, the program continued to develop 282.7 acres of various types of habitat for flood mitigation and 19.38 acres for enhancement. The program is also in the process of developing 36,350 linear feet of shaded riverine aquatic habitat, of which 12,898 linear feet will be used for mitigation and 23,452 linear feet for enhancement.

Completed mitigation and enhancement projects include

- Medford Island
- Terminus Tract
- Twitchell Island setback levee
- Staten Island berm and channel islands
- Wright Elmwood Tract
- Thornton–New Hope Tract (Grizzly Slough)
- Palm Tract
- Bethel Island, and
- Canal Ranch attached berm

Projects underway include

- Decker Island
- Lower Sacramento River revegetation, Grand Island in participation with the Corps
- Kimball Island

- Prospect Island
- Sherman Island berm
- Sherman Island Parcel 11
- Webb Tract Site 3
- Franks Tract, and
- the last phase of Tyler Island

Projects that have been proposed include Veale Tract and McCormack-Williamson Tract.

The Department, DFG, and reclamation districts are making substantial progress in providing adequate avoidance or mitigation of net long-term habitat losses and in enhancing habitat in the Delta. Many participating districts are identifying potential habitat mitigation and enhancement areas that may be developed into diverse habitats as the program's habitat development process moves forward. The Department and DFG will continue to work with the reclamation districts to improve the quantity and quality of habitat in the Delta.

Subsidence Investigations

Organic soils in the Sacramento-San Joaquin Delta are now between 10 and 25 feet below sea level. The peat has oxidized and subsided since the mid-1800s, when the land was first drained and levees constructed. The Legislature recognized the problem and, with the initiation of the Delta Flood Protection Act, the Department began monitoring subsidence and studying its causes.

The Department and the U.S. Geological Survey conduct an ongoing subsidence investigation in the Delta. Preliminary data indicate that

- land management practices substantially influence subsidence rates;
- cultivation practices that raise soil temperature and lower the water table dramatically increase oxidation of the peat soils;
- conversion of highly organic peat soils to carbon dioxide gas appears to be the primary cause of subsidence; and
- the presence of vegetation mats suggests that shallow permanent flooding will reverse subsidence through biomass accretion.

In 1999, CALFED granted Category III funds to the Department to construct a Subsidence Reversal Demonstration Project on Twitchell Island. In 2001, USGS and area consultants will set up a learning laboratory to find ways to reverse subsidence. This project will combine the cultivation of tules and other aquatic vegetation in shallow ponds with diversion and settling of silt-laden water from the San Joaquin River. The soil build-up and organic soil oxidation rates will be measured.

Reuse of Dredged Material for Delta Levees

As local sources of fill material for levee repair are depleted, new economical sources must be located. The Department, in coordination with the Corps, local reclamation districts, and the Central Valley Regional Water Quality Control Board, implemented three pilot projects—at Sherman, Twitchell, and Jersey Islands—to demonstrate the viability of relocating material from the San Francisco Bay Area to the Delta. These pilot projects required extensive monitoring and testing programs and no adverse salinity impact were found.

Based on these results, the Central District Flood Protection and Geographic Information Branch worked on increasing opportunities to reuse clean, bay-dredged materials in the Sacramento-San Joaquin Delta.

Current efforts for beneficial reuse of dredged material from the Bay Area principally consist of

- coordination with the regional board to address water quality concerns;
- discussions with the Corps to promote identification and acquisition of federal funds to support beneficial reuse projects;
- assistance to the Long-Term Management Strategy and Save the Bay in preparing proposals to CALFED to evaluate the potential for Delta reuse of clean, dredged material from San Francisco Bay;
- coordination with the Corps, Regional Board, CALFED, and RD 341 to stockpile dredged material from Suisun Bay and New York Slough on Sherman Island—this is a long-term project and could consist of 200,000 cubic yards of dredged material annually for 5 years. This project will be initiated by a demonstration

project with 150,000 cubic yards coupled with an intense monitoring program; and

- levee restoration and habitat projects proposed or under construction.

Levee restoration and habitat projects worked on in 1999 include

- stability berms on Bradford Island to reinforce cracking and foundations;
- long-term levee improvements on Sherman Island, including stability berms to strengthen levees in critical areas;
- stability berms to strengthen historically weak levees along Three Mile Slough on Twitchell Island;
- design of a 42-acre island for habitat restoration on Franks Tract;
- levee repair of areas with stability and seepage problems on Webb Tract; and
- design of a 2.2-acre island in the San Joaquin River for the Sherman Island Berm Demonstration Project.

Levee Upgrades

The Department funds upgrades to the levees according to standards contained in Bulletin 192-82, *Delta Levees Investigation*. According to those standards most levees should be high enough to protect against overtopping by flood stages with a 300-year flood. The minimum freeboard should be 1.5 feet for levees protecting agricultural land, and 3 feet for levees protecting urban areas. A typical improved levee section should have a 16-foot crown width with a waterside slope of 2 horizontal to 1 vertical.

In August 1991, the Corps, USBR, and the Department signed a feasibility cost-sharing agreement for a special study of the Sacramento-San Joaquin Delta. Updating an earlier 1982 study, the 1991 special study provided for investigation of solutions for Delta flood protection, salinity intrusion, recreation, and navigation. In accordance with the Water Resources Development Act of 1986 and the federal policy of incurring no net loss of habitat, the 1991 study included environmental and wildlife habitat restoration measures. The study also considered the Department's management plans for water supply and flood control when developing alternatives for a comprehensive Delta plan.

This special study is divided into two phases. Phase I began in September 1991 and ended in March 1993. The Phase I report, called the *Initial Report*, described problems, possible solutions, and opportunities to improve and/or provide flood protection, fish and wildlife habitat, water quality, recreation, and navigation. The *Initial Report* included a plan that identified existing and future land uses in years 2000, 2020, and 2040. The report discussed developing a comprehensive plan, primarily for flood control, navigation, and environmental restoration.

In Phase II, a Regional Planning Report for environmental restoration, flood control, and navigation continues to be developed. The goal of this report is to develop a region-wide plan for Corps involvement in the Delta that links to the other planning efforts. The Regional Planning Report will incorporate and be closely coordinated with CALFED long-term policies and plans. Other Phase II current efforts are to

- design and construct a levee test section;
- study borrow material sources; and
- study dredged material reuse.

In addition, a joint program has been planned to investigate other reuse opportunities and technical studies of sediment traps, water quality effects of sediment reuse, subsidence control, and habitat restoration. These investigations will demonstrate the value of sediment reuse and will continue to build momentum for developing solutions to Delta problems, particularly for flood-control issues.

Delta Water Rights Management

Several agencies in the western Delta have rights to water in the Delta. To manage those water rights and resolve issues associated with them, the Department negotiated water rights management contracts with some of the agencies concerned. Those agencies serve agricultural, municipal, and industrial users of Delta water.

Delta Agricultural Water Users

In 1974, the Delta Water Agency was replaced by six Delta agricultural water agencies—North Delta Water Agency, SDWA, Central Delta Water Agency, East Contra Costa Irrigation District, Contra Costa County Water Agency, and Byron-Bethany Irrigation District. Two of those agencies—NDWA and

ECCID—signed water-rights management contracts with the Department in 1981. The Department also negotiated contracts, or is requesting negotiations, with other agencies to provide for water level, circulation, and quality needs in certain areas.

South Delta Water Agency Contract

In September 1990, the Department completed negotiations for a long-term agreement with SDWA and USBR. Under the proposed SDWA contract, the parties agreed to proceed with the design, construction, and operation of certain barrier facilities in the channels of the south Delta. The facilities resolved those portions of the lawsuit that SDWA filed in 1982 regarding the alleged effects of export pumping by the SWP and/or CVP on water levels, quality, and circulation in the south Delta.

U.S. Army Corps of Engineers

In addition to its historical leadership in flood control, the U.S. Army Corps of Engineers regulates structures or work affecting navigable waters of the United States according to Section 10 of the Rivers and Harbors Act (Title 33, United States Code, Section 403 [1899]) and any activity which results in discharges of dredged or fill material into waters of the United States (which includes wetlands), according to Section 404 of the Clean Water Act.

U.S. Bureau of Reclamation

The U.S. Bureau of Reclamation manages the operation of the Central Valley Project and shares with the Department responsibilities for meeting water quality and flow objectives in the Delta. The CVP delivers about 7 million acre-feet of water a year to contractors in the Sacramento and San Joaquin Valleys and parts of the San Francisco Bay Area. Under the requirements of the CVP Improvement Act, USBR also supplies water for fisheries and wildlife refuges in the Central Valley.

Because the Department and USBR share Delta responsibilities, the Department coordinates SWP operations with USBR according to terms and conditions of the Coordinated Operation Agreement, signed in 1986. That agreement replaced an earlier system of year-to-year agreements regarding the responsibilities of the Department and USBR in the Delta. The COA is significant in that the federal government agreed to accept a significant portion of responsibility for meeting the State Water Resources Control Board's water quality requirements for the Delta, with certain restrictions as to limitations of State and federal authorities.

Since 1990, the Department has installed and operated temporary barrier facilities in the south Delta to improve south Delta conditions and collect data needed to design and operate permanent barrier facilities as proposed in ISDP. In 1999, data collected in the Temporary Barriers Program assessed the barriers' ability to reduce or eliminate adverse water levels and improve local hydraulic circulation patterns.

Western Delta Municipal Water Users

To compensate the Contra Costa Water District and the City of Antioch for purchasing water of usable

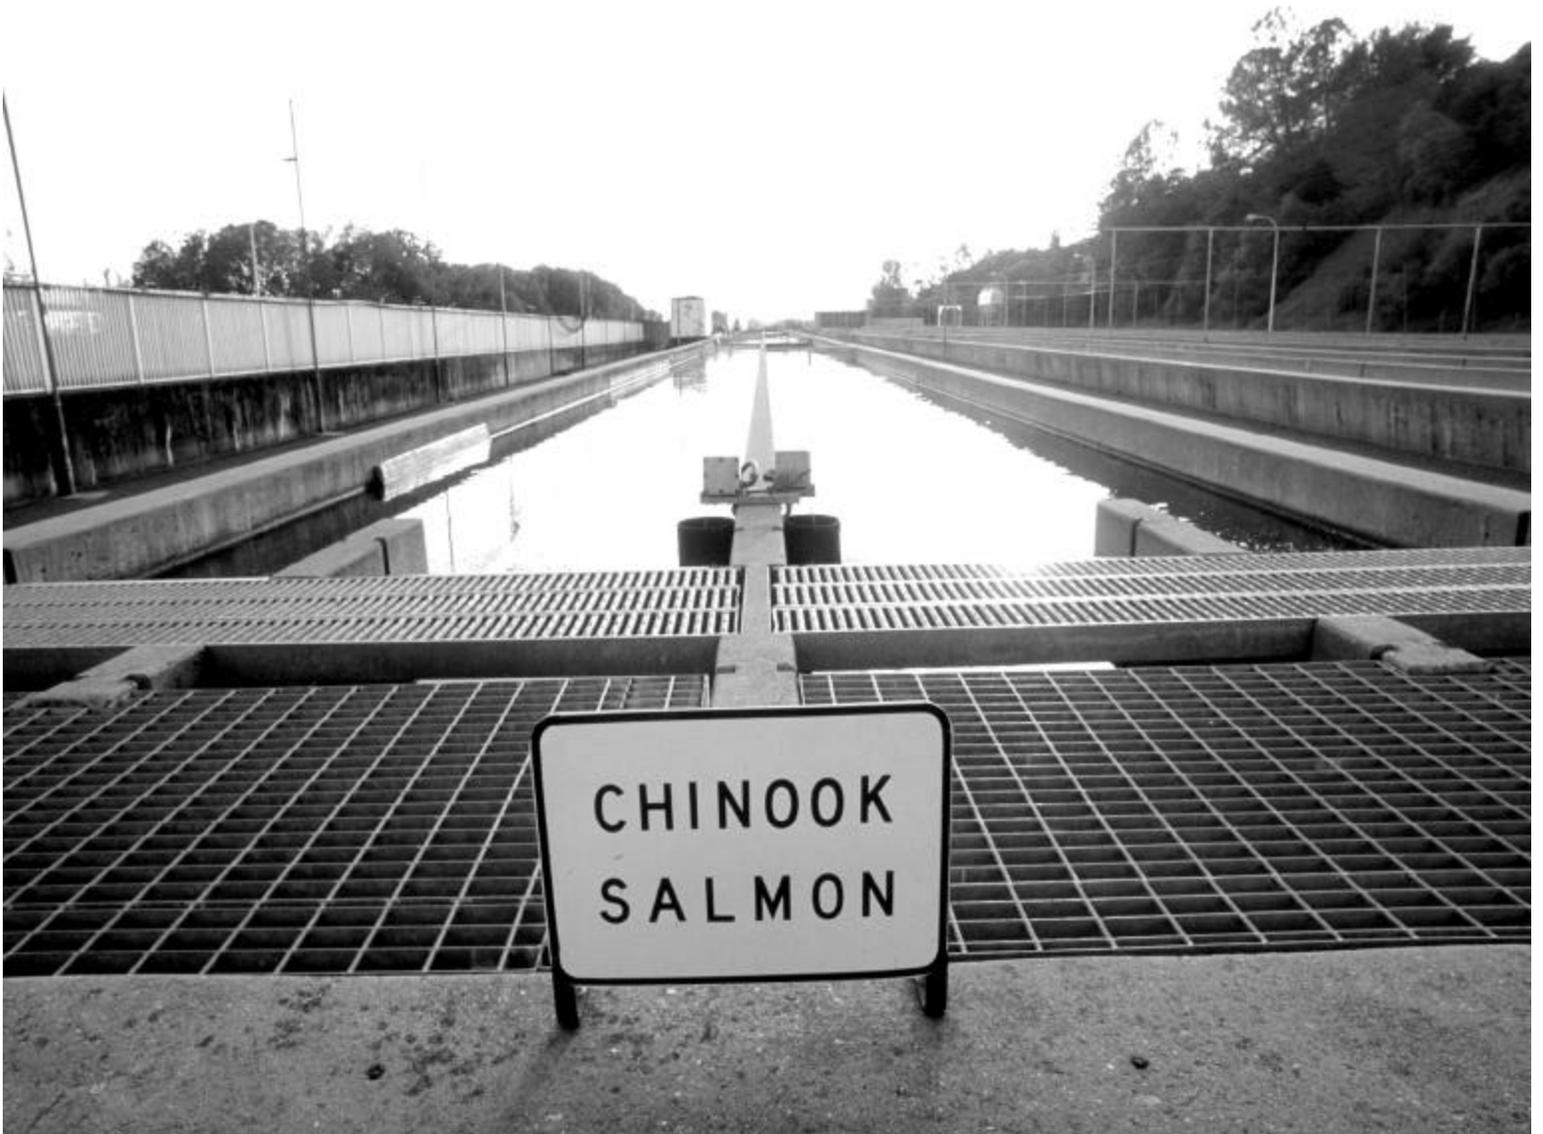

quality when such water is not available from Mallard Slough and the San Joaquin River, respectively, the Department signed contracts with those agencies in 1967 (CCWD) and 1968 (City of Antioch).

According to terms of the contracts, the Department compensates each agency for additional costs of purchasing a substitute water supply from the Contra-Costa Canal to replace water supplies of usable quality lost because of SWP operations. Credits for the number of days of above-average water supplies of usable quality from Mallard Slough and the San Joaquin River accrue to offset the number of below-average days in future years.

Information in this chapter was contributed by the Division of Planning and Local Assistance, the Central District, and the Office of State Water Project Planning.

Chapter 3

Environmental Programs

Feather River Fish Hatchery in Oroville, constructed to compensate for loss of salmon spawning grounds when Lake Oroville was created

Significant Events

- The National Marine Fisheries Service listed Sacramento River spring-run chinook salmon as threatened under the Federal Endangered Species Act and the U.S. Fish and Wildlife Service listed the splittail as threatened under FESA.
- Operational actions that occurred in 1999 to improve conditions for fish species of concern included increasing flows in the San Joaquin River and decreasing Delta exports in April and May to benefit fall-run chinook salmon emigrating from the San Joaquin River Basin; curtailing Delta exports in May and June due to the sustained presence of Delta smelt in the central and southern Delta; and implementing the Spring-Run Chinook Salmon Protection Plan to minimize project impact to spring-run salmon emigrating in the fall.
- The Department implemented eight fishery improvement projects to offset losses at Banks Pumping Plant.

The Department of Water Resources has developed and put into action several programs to avoid, minimize, or offset any adverse impact that might result from construction and operation of State Water Project facilities.

Operations for Fish Species of Concern

Avoiding and minimizing adverse impacts to fish species of concern is a primary consideration in operation of the SWP. A species of concern is one that has been listed or proposed for listing as threatened or endangered by a State or federal fishery agency. Maintaining flexibility in SWP operations is key to avoiding and minimizing adverse impacts to fish of concern. Operational responses can include Delta Cross Channel gate closure, export curtailments, changes in delivery schedules, increased reservoir releases, preferential use of certain facilities, or a combination of these actions.

San Joaquin River Activities

In recent years the Department coordinated with the U.S. Bureau of Reclamation to decrease Delta exports and increase flows in the San Joaquin River from mid-April through mid-May (pulse flow period), to benefit fall-run chinook salmon emigrating from the San Joaquin River Basin. Several studies intended to estimate the relative survival of marked salmon moving through the Delta were performed at the same time as the pulse flow. The goal is to conduct operational changes and associated studies over a number of years to determine if a relationship exists between river flow, Delta exports, and salmon survival through the Delta. The resulting information will be used to determine if changing San Joaquin River flows and Delta exports in the spring can significantly benefit San Joaquin River fall-run chinook salmon.

The Vernalis Adaptive Management Plan, a 12-year research component associated with the San Joaquin River Agreement, directed intensive fisheries sampling in the lower San Joaquin River. Varied

export pumping rates were coordinated with fisheries collection efforts under VAMP from April 17 to May 17 (the pulse flow period). The San Joaquin River Agreement is an effort by water right holders to satisfy the goals of the Bay-Delta Accord.

As part of VAMP, temporary barriers were constructed to

- provide an adequate water supply for south Delta water diverters;
- improve water quality conditions in the Stockton Deep Water Channel; and
- prevent chinook salmon from entering Old River, thereby reducing the likelihood of entrainment at the south Delta facilities.

Temporary barriers were installed on Middle River and Old River near Tracy on June 1, 1999, and the Grant Line Canal barrier was completed on June 3, 1999. The barriers were removed on October 1 due to the end of irrigation water needs and possible conflicts with winter-run salmon.

Spring-Run Chinook Salmon Protection Plan

The Protection Plan outlines a monitoring program, identifies indicators that would trigger a response, and identifies possible actions to minimize SWP and Central Valley Project impacts on emigrating yearling spring-run salmon. Flow, turbidity, and either fish movement or fish presence are all continuously monitored using in-stream measurements, surveys, and fish screw traps. Potential triggers include an increase in flows or turbidity in the Sacramento River and its tributaries, fish migration toward the Delta, and the detection of spring-run salmon at the export facilities. Possible actions include the closure of the Delta Cross Channel gates and export reductions. Implementation of the Plan continued in 1999.

The gates were closed several times in November and December because fish sampling found young salmon in the north Delta.

Delta Export Curtailments Due to Delta Smelt

The biological opinion on the effects of SWP/CVP operations on Delta smelt uses the combined (SWP and CVP) Delta smelt salvage as a threshold to reinitiate consultation between USFWS, USBR, and the Department. If needed, further actions are taken to reduce water project impact on Delta smelt. These thresholds include

- the 14-day running average of combined SWP and CVP Delta smelt salvage, commonly referred to as the *yellow-light level*; and
- the cumulative total of combined salvage for each month, commonly referred to as the *red-light level*.

The red-light level is based on historical salvage data and varies by month and water year type. For example, in an above-normal water year, the red-light level ranges from 733 fish in December to 11,990 fish in October. Monthly red-light levels for below-normal water years are generally higher—as much as six times higher—than levels for above-normal water years. Reaching the yellow-light triggers informal consultation to consider options for reducing Delta smelt take. Reaching the red-light triggers formal reconsultation among the agencies to determine whether additional actions are necessary to avoid jeopardizing the species.

In 1999, combined Delta smelt salvage frequently exceeded the specified take levels from mid-May through early July. The yellow-light level was exceeded on May 19, and the red-light level (9,769 Delta smelt) was exceeded the following day. By the end of May, total monthly salvage (58,943 Delta smelt) exceeded the red-light level by more than six-fold. The SWP and CVP combined salvage remained high throughout June. On June 6, the take limits already exceeded the red-light level (10,709 Delta smelt). By June 18, Delta smelt salvage declined and, in response, combined pumping was increased on June 20. On June 23, combined salvage increased greatly for 2 days, with even greater numbers of Delta smelt salvaged on June 29 and 30 (more than

22,500 Delta smelt). Combined salvage by June 30 (73,368 Delta smelt) exceeded red-light levels by seven-fold. Delta smelt salvage declined after July 3, and combined salvage fell below the yellow-light level by mid-month.

In response to high Delta smelt salvage, several actions were implemented by the CALFED Operations Group and its subgroups—the No-Name Group, the Data Assessment Team, and the Delta Smelt Work Group. These actions included SWP export reductions from May 27 through May 31 and again from June 7 through June 12. Other actions included

- initiation of reconsultation with USFWS;
- closure of the Delta Cross Channel gates until May 28;
- delay of a proposal to relax the export/inflow ratio until after the end of June; and
- establishment of No-Name Group conference calls to develop mechanisms to deal with incidental take of Delta smelt in future years.

Decisions to List Additional Fish Species

Federal fish and wildlife agencies listed additional fish species as threatened in 1999. Listing increases a species' impact on project operations. NMFS listed Central Valley steelhead trout as threatened under FESA in March 1998, but still had not adopted a 4(d) rule as of December 31, 1999. The 4(d) rule determines if and when NMFS needs to authorize the incidental take of the fish.

NMFS listed Sacramento River spring-run chinook salmon as threatened under FESA in 1999 and determined that the Central Valley fall-run/late fall-run race did not warrant listing but remains a candidate species. Sacramento River spring-run chinook salmon were listed as threatened under the California Endangered Species Act in 1998.

The Department and USBR consulted with NMFS and DFG about the potential impact of SWP and CVP operations on steelhead and spring-run chinook salmon. A 1-year biological opinion and take authorization for these species were provided in 1999. The

Department and USBR, through the CALFED Operations Group, continued the Spring-Run Chinook Salmon Protection Plan to provide greater and more immediate protection for the species during fall 1999.

USFWS listed splittail as threatened in 1999. This species had been considered for listing since 1994. USBR and the Department resumed consultation with USFWS to develop an incidental take statement for operation of the SWP and CVP.

Fish Population Estimates

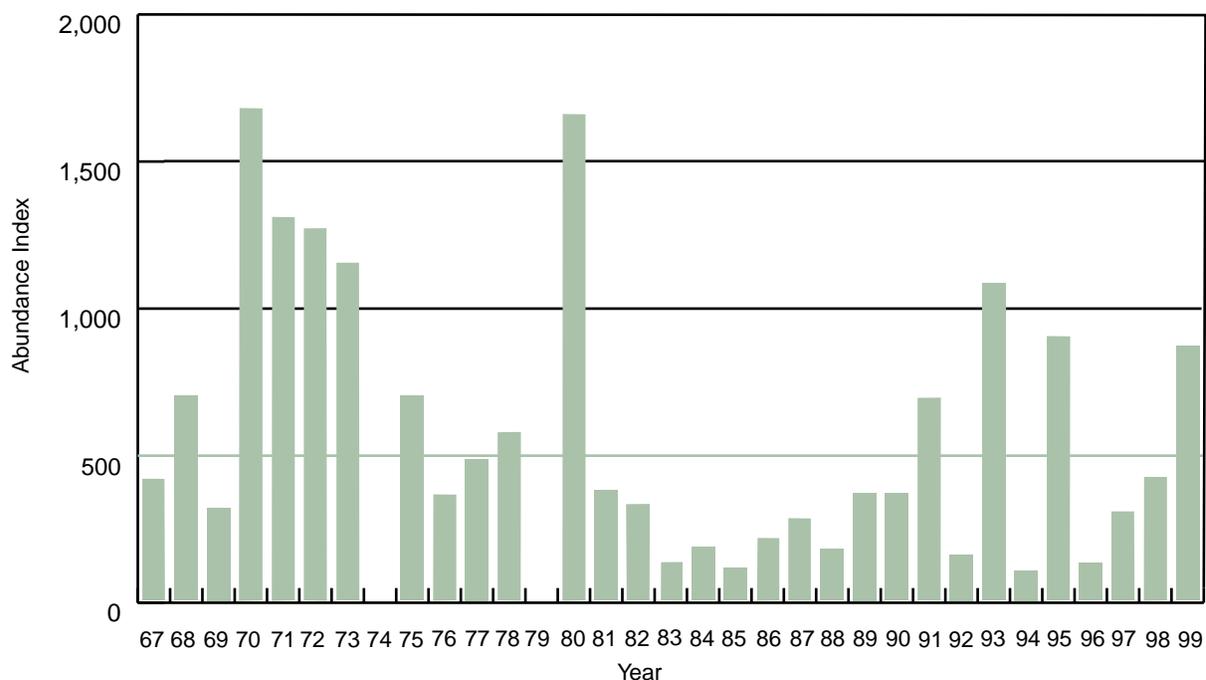

Figure 3-1 shows the abundance index for Delta smelt from 1967 through 1999, based on fall midwater trawl sampling. The fall abundance index is significant because it provides one of the best indicators of the status of the adult Delta smelt population. The index for 1999 showed a noticeable increase over sampling results from 1996 through 1998. Scientists do not know what causes these variations in abundance.

Figure 3-2 shows estimates of returning adult winter-run chinook salmon from 1967 through 1999.

The estimates are referred to as escapement estimates—the number of adults that escape mortality and return to spawn. The estimated escapement for 1999 was 3,200, which more than tripled the estimated 900 adults in the parent stock of 1996. This is a positive sign for winter-run salmon, as it demonstrates a continued increase of the reproductive population. Factors such as improved spawning and rearing habitat, reduced losses in the Delta, and reduced commercial fishing losses are all thought to have benefited winter-run salmon.

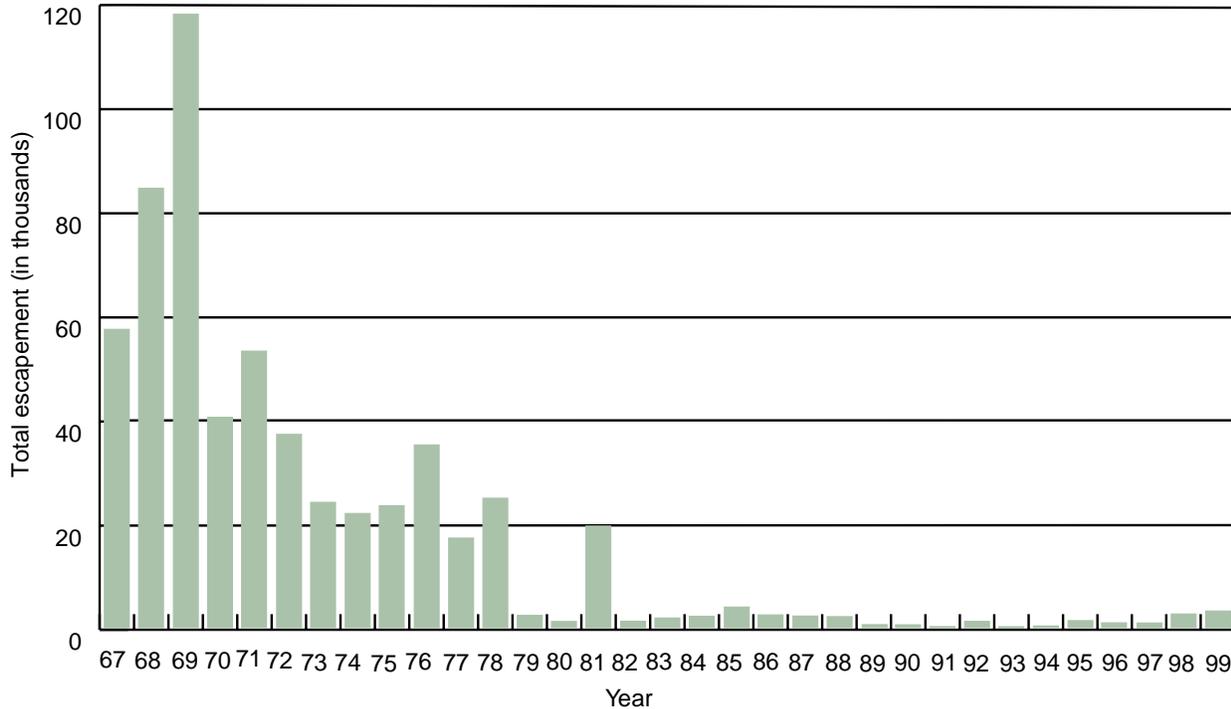

Figure 3-3 shows estimates of returning adult spring-run chinook salmon for the period 1990 through 1999. Individual estimates are shown for Deer Creek, Mill Creek, Butte Creek, and the Feather River—the principal spawning streams for this race of salmon. The escapement estimates are shown separately for each stream because the Feather River estimate is based on returns to Feather River Hatchery, where the genetic integrity of spring-run chinook salmon is uncertain. The estimated escapement for 1999 was 3,730 for the Feather River Hatchery and about 5,750 for the other streams combined. The 1999 Feather River Hatchery escapement is only about 60 percent of the 1996 parent stock escapement, but the 1999

Figure 3-1
Delta Smelt Fall Midwater Trawl Abundance Index, 1967 through 1999

Note: No sampling in 1974 or 1979.

Figure 3-2
Estimated Total Winter-Run Chinook Salmon Escapement, 1967 through 1999

escapement of naturally spawned fish more than doubled that of 1996. Factors such as improved spawning and rearing habitat, reduced losses in the Delta, and reduced commercial fishing losses are all thought to have benefited spring-run salmon.

Due to lack of comprehensive monitoring programs, there are no reliable escapement estimates for Central Valley steelhead.

Figure 3-4 shows the fall midwater trawl index for young-of-the-year splittail for the period 1967 through 1999. The 1999 index was lower than 1998, but this was not surprising, since the 1998 index was the highest on record. The 1999 index was slightly above average for the period of record. Splittail reproduce in spring and appear to have higher reproductive success in years when ample seasonally flooded habitat (such as Sutter and Yolo Bypasses) is available. This habitat was available for a portion of the splittail spawning season in 1999.

Feather River Fish Studies

Joint Department and DFG salmon studies continued in 1999 on the lower Feather River and at the Feather River Hatchery. These studies will help support the Department in the upcoming process to renew the Federal Energy Regulatory Commission license for the Oroville facilities.

Studies in 1999 focused on documenting the number and distribution of in-channel adult fall-run salmon. As in previous years, the number and distribution of adult fall-run salmon suggest that superimposition of spawning adults is a major problem in the river, particularly in the low-flow channel. Superimposition occurs when salmon repeatedly spawn in the same location, digging up previously deposited eggs and smothering other nests. This type of excessively localized spawning activity appears to be related to salmon density and flow distribution. It appears that an increased flow from the low-flow channel may attract more salmon to the upper reach of the river, exacerbating the problem. This effect may outweigh benefits

Figure 3-3
Estimated Spring-Run Chinook Salmon Escapement, 1990 through 1999

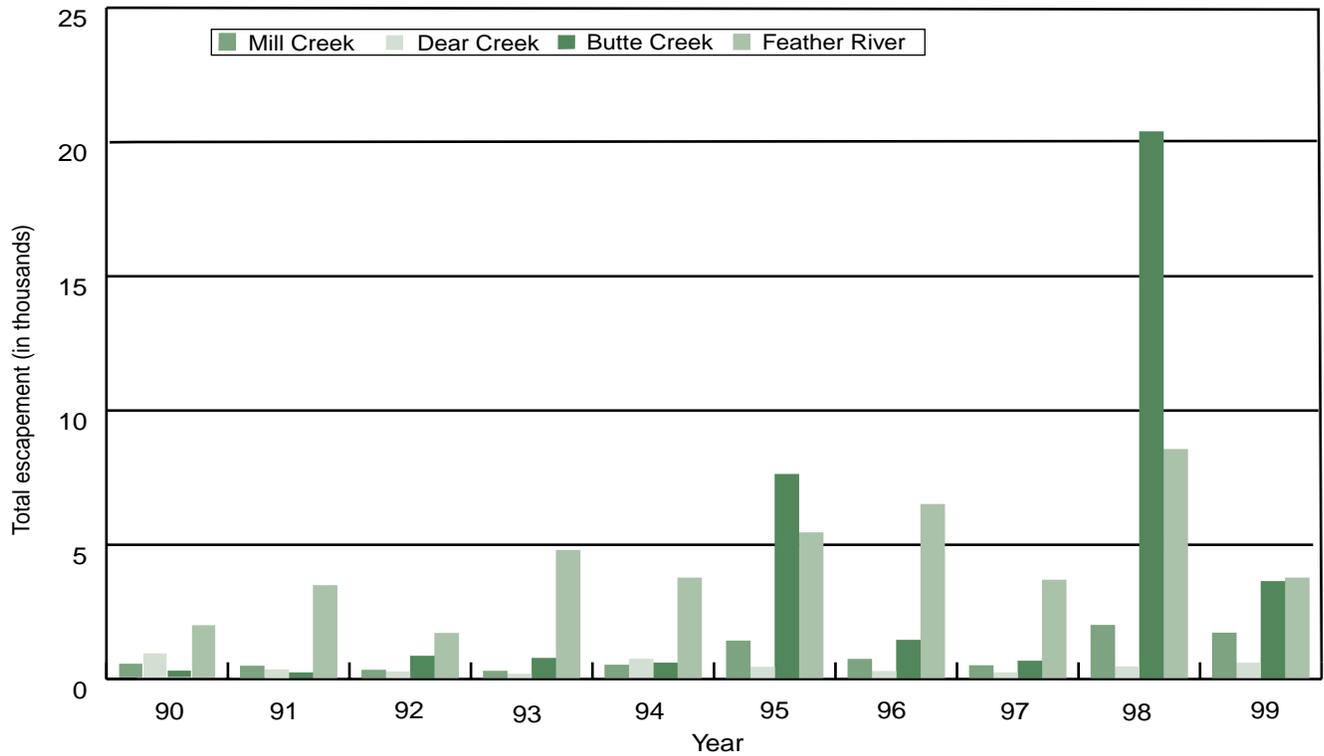

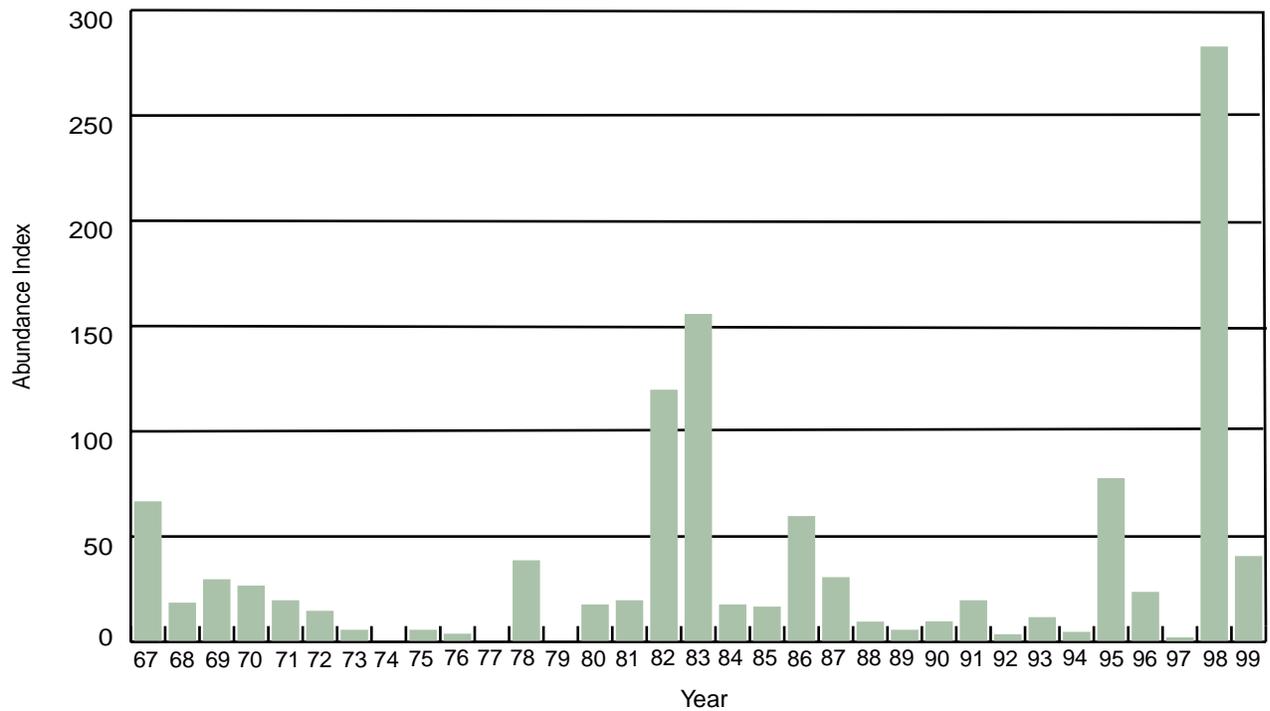

Figure 3-4
Young-of-the-Year Splittail Abundance Index, Fall Midwater Trawl, 1967 through 1999

Note: No sampling in 1974 and 1979. Insufficient data in 1977.

from the increased spawning areas available at higher flows. A yearly trend toward higher densities of salmon spawning immediately downstream of the Feather River Hatchery suggests hatchery operations may also play a role in spawning superimposition. This hypothesis will be investigated in coming years, using results from a tagging program at the hatchery.

Mitigation Projects

In 1986, the Department and DFG signed the Four Pumps Agreement to annually provide funds to replace fish lost at the intake facility. It also provides \$15 million for additional projects to compensate for losses prior to 1986. Although the agreement focuses on chinook salmon, striped bass, and steelhead, it also considers other fish.

Since 1986, the Department has spent \$30 million on mitigation projects developed under this agreement. These projects include improving salmon spawning and rearing habitat, planting hatchery- and net-pen-reared striped bass, implementing a conjunctive-use project to improve salmon migration flows in Mill Creek in Tehama County, constructing fish ladders and screens on Butte Creek, constructing fish screens in Suisun Marsh, and enhancing enforcement of fish and game laws in the Delta and upstream to benefit salmon, steelhead, and striped bass and to increase protection for spring-run salmon.

In 1996, DFG and the Department amended the agreement to

- provide another 5 years to spend the remaining \$9 million of the \$15 million lump sum provided in the agreement; and

- specify the likely allocation of the remaining funds.

Because of difficulties in developing mitigation projects, the Department could not spend the full \$15 million lump sum in the 10 years required by the original agreement. The remaining funds were tentatively allocated to provide

- \$2 million for screening diversions in Suisun Marsh;
- \$1 million for predator-isolation projects on San Joaquin River tributaries;
- \$2 million for a conjunctive-use project to improve spring-run salmon migration in Deer Creek in Tehama County; and
- \$4 million for a salmon conservation hatchery on the Tuolumne River.

Other mitigation projects approved in 1999 for implementation from the agreement's annual and \$15 million lump sum funds include

- a 3-year extension of increased law enforcement protection for spring-run salmon on the upper Sacramento River tributaries during adult migration, summer hold-over, and spawning;
- stocking 151,000 yearling striped bass in 1999 with plans to stock up to 1,275,000 yearlings in 2000 and 2001;
- more funding for constructing a salmon habitat project on the Merced River to improve salmon survival by eliminating predator habitat from rearing areas and migration pathways and by improving salmon-spawning habitat; and
- operating a pen to acclimate hatchery-reared salmon during their release into San Pablo Bay to improve their chances of survival.

Information in this chapter was contributed by the Environmental Services Office and the Division of Operations and Maintenance.

Chapter 4

Water Quality Programs

Conducting water quality testing in mobile lab unit

Significant Events

- On June 25, 1999, the CALFED Bay-Delta Program issued its Draft Programmatic Environmental Impact Statement/Environmental Impact Report outlining its plan to restore the health of the Bay-Delta, provide a reliable water supply for all uses, and improve water quality in California. The release of the Draft EIS/EIR began a 90-day public review period that included 15 public hearings held throughout the State from August 18 through September 22, 1999. CALFED's plan is the result of 4 years of extraordinary cooperative efforts among State and federal agencies and stakeholder groups. The Final EIS/EIR is expected to be implemented June 2000. The plan is expected to cost \$10 billion and take 30 years to complete.
- The Delta Cross Channel gates were closed on November 26, 1999, to protect emigrating juvenile salmon from straying into the interior Delta. The Delta Cross Channel gate closure, coupled with high exports and low Delta outflow conditions, resulted in increased salinity in the interior Delta. By December 6, interior Delta salinity reached the recommended level for opening the gates in the Spring-run Salmon Protection Plan; on December 8 the CALFED Operations Group met to review the recommended actions. On December 10, with the gates still closed, the State Water Project and Central Valley Project reduced exports and SWP releases to the Feather River were increased to help improve Delta water quality. Exports were reduced again on December 13. The gates were opened on December 14 and remained open through the end of December 1999; however, the chloride level at the Rock Slough intake continued to rise and exceeded the standard, averaging 258 mg/L on December 20.
- On December 29, 1999, the State Water Resources Control Board adopted the Final EIR and Decision 1641 implementing the water quality objectives of the San Francisco/Sacramento-San Joaquin Delta Estuary and approving the petition to add points of diversion to the SWP and CVP. D-1641 replaces Decision 1485 as modified by Water Right Order 98-9 and conditions the water rights permits of the SWP and CVP to implement the objectives of State Water Resources Control Board's Bay-Delta Water Quality Control Plan. D-1641 covers Phases 1-7 of the Bay-Delta Water Rights Hearings, leaving Phase 8, the allocation of responsibility for meeting the Delta outflow objectives, to be considered in year 2000 or early 2001.

Many Californians rely on the State Water Project for part or all of their daily residential water needs. Water for agriculture, industry, power generation, recreation, and fish and wildlife is also provided by the SWP. The Department monitors SWP water quality throughout the system, using an automated network of continually operating recorders and laboratory analyses of field samples collected weekly, monthly, quarterly, or annually.

Delta Activities

The SWRCB sets water quality objectives for beneficial water uses. The Department of Health Services establishes maximum contaminant levels for treated drinking water. Additional water quality objectives at points of delivery are set by Article 19 of the long-term SWP water supply contracts. Water quality in the Delta and Suisun Marsh is protected under SWRCB D-1485, as amended by Water Right Order 95-6, and subsequently by WR 98-9, to be consistent with the Principles for Agreement on Bay-Delta Standards, December 15, 1994 (Bay-Delta Accord).

The Bay-Delta Accord, formulated by CALFED and representatives of several urban, agricultural, and environmental water interests, was intended to be in effect for 3 years. The Accord established new outflow standards, modified the criteria for implementation of the California Endangered Species Act to increase water project operations flexibility, and contained a funding mechanism for nonflow-related measures (Category III).

SWRCB adopted a water quality control plan for the Bay-Delta (1995 Bay-Delta Plan) in May 1995, incorporating the agreements reached in the Accord. In June 1995, SWRCB adopted WR 95-6, an interim order amending the terms and conditions of

State Water Resources Control Board

The State Water Resources Control Board, established by the California Legislature in 1967, oversees water rights and water quality for California. Among its many responsibilities, SWRCB issues permits for the use of all water except groundwater and riparian water; distributes State and federal loans and grants for constructing sewage facilities; adopts water quality control plans, regulations, and policies; and sets water quality standards for the Delta.

To implement its mandate to set Delta water quality standards, SWRCB issued Water Right Decision 1485, Sacramento-San Joaquin Delta and Suisun Marsh, in 1978. That decision focused on SWP and CVP water right permits and operations, requiring the SWP and CVP to maintain Delta water quality as it would have existed without the projects. However, after Decision 1485 was adopted, various water users as well as the federal government challenged it in court. Since then, SWRCB updated its Water Quality Control Plan. It was adopted on May 22, 1995. Water Right Order 95-6 amended D-1485 to be consistent with the plan on June 8, 1995. Water Right Order 95-6 modifies the standards for Suisun Marsh and allows the CVP and SWP to use either project's Delta pumping plant to pump project water to increase fish protection and maintain project delivery capability. Water Rights Order 98-9, adopted by the SWRCB on December 3, 1998, extended the terms and conditions of WR 95-6 to allow time for the issuance of a comprehensive Water Rights Decision.

On December 29, 1999, SWRCB issued Decision 1641, replacing D-1485, and conditioning the water right permits of the SWP and CVP to implement the objectives of the Bay/Delta Water Quality Control Plan. D-1641 covers Phases 1-7 of the Bay/Delta Water Rights Hearings. Phase 8, the permanent allocation of responsibility to meet the Delta outflow objectives now temporarily assigned to the Department and USBR, is still under consideration.

SWRCB's D-1485, and the SWP and CVP water rights permits to be consistent with the Bay-Delta Accord. WR 95-6 gave the SWP and CVP the right to jointly use each other's point of diversion in the south Delta (Banks and Tracy Pumping Plants) to avoid causing significant adverse effects to the environment.

In December 1997, CALFED extended the Bay-Delta Accord for 1 year, and again in 1998 to allow CALFED time to continue working on a long-term plan. On December 3, 1998, SWRCB adopted WR 98-9. The order is an interim order that continues the modified temporary terms and conditions set forth in WR 95-6. It was set to expire upon either adoption by SWRCB of a comprehensive water rights decision allocating final responsibilities for meeting the 1995 Bay-Delta objectives or on December 31, 1999, whichever came first. SWRCB held several public water rights hearings during 1999 as part of its comprehensive Bay-Delta water rights process to consider alternatives for implementation of the 1995 water plan and consider impacts of and responsibility for meeting the objectives. On December 29, 1999, SWRCB adopted D-1641 to replace D-1485, as modified by WR 98-9.

In addition to extending the terms and conditions of WR 95-6, WR 98-9 increased the time allowed for payback pumping through the joint-point of diversion permit from 6 months (specified in WR 95-6) to 1 year. WR 98-9 also required that the Department and U.S. Bureau of Reclamation consult with the South Delta Water Agency, submit a response plan, and receive SWRCB's permission prior to joint-point pumping. The response plan specifies departmental and USBR actions to ensure adequate southern Delta channel water levels for agricultural diversion. The order also directed both agencies to conduct studies to develop a better understanding of the effect of make-up pumping on central and south Delta water channels.

WR 95-6 established the Suisun Ecological Workgroup and set August 1997 as the date for a final report on the impact of new 1995 Bay-Delta Plan Suisun Marsh standards. SEW submitted an interim report in September 1997. SWRCB's WR 98-9 extended the final reporting date to June 1, 1999. Prior to adopting WR 98-9, SWRCB adopted

WR 98-6, which authorized the Department and USBR to vary flows to meet certain Suisun Marsh salinity standards and waive standards during salmon passage experiments—October 1998 to May 2001.

The Bay-Delta Accord specifies that compliance with the incidental take provision of the Federal Endangered Species Act was not intended to result in any additional water costs to the SWP and CVP water supply. Thus, the Accord allows for some operational flexibility through the deliberations of the CALFED Operations Group. Both the SWP and CVP operate in accordance with biological opinions regarding Delta smelt and winter-run chinook salmon. These two opinions were revised March 6, 1995, and May 17, 1995, respectively, to conform with the Accord.

SWRCB's issuance of D-1641 is part of their implementation of the 1995 Bay-Delta Water Quality Control Plan and accordingly this decision amends certain water rights of the water rights holders to help achieve the plan's objectives. While Phase 8, the allocation of responsibility to meet the Delta outflow objectives of D-1641, is still under consideration, the following amendments are included in the decision:

- The decision expands upon the responsibilities of the Department and USBR, including some objectives that were not included in the two previous limited term orders. These additional objectives involve southern Delta agricultural salinity standards that were listed in the 1995 Bay-Delta Water Quality Control Plan, but prior to D-1641 no water rights holder had responsibility under a water right permit to meet these salinity objectives.
- In contrast to the above expansion of responsibilities, the decision relieves the Department and USBR of the responsibility of meeting salinity objectives at two locations in the western Suisun Marsh: Morrow Island (S-35) and Ibis Club (S-97). D-1641 further allows some variability in meeting the remaining Suisun Marsh salinity objectives.
- The decision also approves a joint petition of the Department and USBR to change points of diversion of the SWP and CVP in the southern Delta. The decision further approves a USBR petition to change CVP places and purposes of use.

D-1641 also approves the San Joaquin River Agreement for a period of 11 years. The SJRA facilitates the implementation of the Vernalis Adaptive Management Program that is designed to gather information on the effects of exports and San Joaquin River flows on the survival of San Joaquin fall-run chinook salmon.

The balance of the permit amendments in the decision involves the recognition of various memorandums of understanding, stipulations, and agreements among various groups, including the Department, that seek to resolve questions of responsibility for meeting the water quality objectives contained within the Water Quality Control Plan.

The Department conducts extensive monitoring to protect beneficial uses of water in the Delta and Suisun Marsh as required by SWRCB's D-1485, and subsequent D-1641. Figure 4-1 shows water quality monitoring sites throughout the Sacramento-San Joaquin Delta.

Water Supply Conditions

Water Year Classifications and Water Supply Indexes

The 1998-99 water year was classified as *wet* or *above normal* for most of California, and it was Northern California's fifth wet year in succession, a phenomenon that is unprecedented in the records of the twentieth century. (For a detailed discussion of the 1998-99 water year, see Chapter 8.)

SWRCB's 1995 Bay-Delta Plan contains water quality objectives conditioned by water year type, which, in general, become less stringent in more critically dry years. The water year classification system provides relative estimates of a basin's available water supply from the amounts of rainfall, snowmelt runoff, and groundwater accretion rates. Water year types can be classified as *wet*, *above normal*, *below normal*, *dry*, and *critical*.

The Bay-Delta Plan applies a water supply forecast tool, called the Sacramento Valley 40-30-30 Index, to replace the Sacramento River Index. SWRCB first introduced the Sacramento Valley 40-30-30 Index in its 1991 Water Quality Control Plan for Salinity. The

Bay-Delta Plan proposes to further refine the Sacramento Valley 40-30-30 Index by eliminating the sub-normal snowmelt and "year following dry or critical year" provisions found in D-1485.

The Sacramento Valley unimpaired runoff lists the major flows into the Sacramento Basin. The factors used in the Sacramento Valley 40-30-30 Index are the following: (1) the contribution of the current year's April through July Sacramento Valley unimpaired runoff (40 percent), (2) projected current October through March Sacramento Valley unimpaired runoff (30 percent), and (3) the previous year's Sacramento Valley 40-30-30 Index (30 percent, with a 10-million-acre-feet capacity limit).

The 1995 Bay-Delta Plan also includes a water supply forecast tool called the San Joaquin Valley 60-20-20 Index, which uses methods similar to the Sacramento Valley 40-30-30 Index. The sum of both indexes—the Eight River Index—determines the duration of the fish and wildlife salinity/flow standard at Chipps Island or Port Chicago during February through June.

The April through July Sacramento Valley unimpaired runoff forecast for May 1, 1999, was 7.92 million acre-feet (120 percent of average). The resulting Sacramento Valley 40-30-30 Index was 10 million acre-feet (a 25 percent decrease over the Sacramento Valley 40-30-30 Index of 13.31 million acre-feet in 1997-98). The water year was classified as *wet* for all beneficial uses. The San Joaquin Valley 60-20-20 Index was classified as *above normal* for 1999 at 3.5 million acre-feet. The Eight River Index forecast was 11.6 million acre-feet for April through July.

Operations under the Bay-Delta Accord, Amended D-1485, and the Winter-Run and Delta Smelt Biological Opinions

The Department and USBR continued to operate the projects in accordance with the 1994 Bay-Delta Accord, 1995 Bay-Delta Plan, and WR 95-6 that brought D-1485 and Decision 1422 into conformance with the Accord, and WR 98-9 that extended the

terms and conditions of WR 95-6 through the end of 1999. The Accord established water quality, flow, and operational criteria for the estuary. Operations of the SWP and CVP were to be guided by the CALFED Operations Group through coordination with the Central Valley Project Improvement Act and California Endangered Species Act requirements. The CALFED Operations Group, formed in 1994 by the Framework Agreement between the Governor's Water Policy Council of the State of California and the Federal Ecosystem Directorate, consists of representatives from seven State and federal agencies.

The Framework Agreement also expands real-time monitoring of fish movement and conditions in the estuary to aid daily water management. The purpose of real-time monitoring is to provide more timely protection of targeted fish species from entrainment at the Delta pumping facilities of the SWP and CVP and ensure water supply reliability. (See Chapter 3 for a discussion of other environmental issues.)

Water Quality Standards

Water quality standards and objectives are categorized by the beneficial uses they are intended to protect. These standards include municipal and industrial, agricultural, and fish and wildlife. The Department attempts to meet Bay-Delta Plan objectives and amended D-1485 water quality and flow standards through releases from upstream reservoirs and Delta export operations. However, the 1995 Bay-Delta Plan also addresses San Joaquin River water quality by incorporating the D-1422 Vernalis salinity standard. San Joaquin River flows are not influenced by the SWP's upstream reservoirs, but they may be influenced by SWP exports and placement of south Delta barriers.

During 1999, the Delta Cross Channel gates were open for 193 days. The gates close during January whenever Delta outflow is greater than 12,000 cfs—and any time Sacramento River flow at Freeport exceeds 25,000 cfs—to reduce flooding potential on the Mokelumne River and to prevent scour on the downstream side of the gate structure. SWRCB's 1995 Bay-Delta Plan contains measures that require closure of the Delta Cross Channel gates from February 1 until May 20, during peak migration of

winter and fall-run chinook salmon smolts and steelhead, and the spawning season for Delta smelt, long-fin smelt, Sacramento splittail, and striped bass.

The gates were closed the entire month of January, due to Delta outflow exceeding 12,000 cfs, and remained closed into early June. On June 3, the gates were opened for an uninterrupted period of 176 days, closing on November 26 to prevent out-migrating chinook salmon from straying into the interior Delta. The gate closure occurred at a period of low Delta inflow and high exports in the southern Delta, which caused a salinity increase in Delta water. Salinity levels continued to rise to a level at which opening the Delta Cross Channel gates is recommended in the Spring-run Salmon Plan of Protection. The SWRCB's municipal and industrial chloride standard of 250 mg/L was at risk of being exceeded at the Contra Costa Canal Intake near Rock Slough. The CALFED Operations Group met on December 8 to review the recommended actions. On December 10 the gates were still closed and, in response, the SWP and CVP reduced exports and boosted releases to the Sacramento River in an effort to reduce the salinity levels by improving Delta inflow. Exports were reduced again on December 13 and finally the gates were reopened on December 14. The gates remained open through the rest of the year; however, the chloride level at the Rock Slough intake continued to rise, exceeding the standard, and averaging 258 mg/L on December 20. Chloride levels at Rock Slough can be affected by the circulation of water resulting from exports at Contra Costa Water District's Pumping Plant Number One. The average monthly export rate fell by more than half from November to December 1999, allowing the chloride levels to recede to a daily average of about 200 mg/L by the end of December.

The year-round 250 mg/L chloride standard is also in effect at the other Delta export locations (Clifton Court Forebay, Tracy Pumping Plant, and Barker Slough) where the chloride levels remained below the standard throughout 1999.

There is an additional municipal and industrial water quality standard for chloride at the Contra Costa Canal Intake near Rock Slough that specifies the chloride level must be below 150 mg/L for a given number of days during the year. The wet year

requirement of 240 days was easily met during 1999, despite the period of concern reported above. Specific water quality requirements are set to benefit municipal uses, agriculture, and fish and wildlife. High river outflows, export restrictions, and water releases to benefit migrating fish (both pulse and attraction flows) helped maintain most electrical conductivity values well below objectives.

Agricultural objectives in 1999 included an EC standard of 0.45 mS/cm (14-day running average) during the irrigation season from April to mid-August, set at Emmaton, Jersey Point, Terminous, and San Andreas in the western and central Delta. All of these agricultural salinity standards were met. An additional salinity standard was applied year-round in the southern Delta at Vernalis on the San Joaquin River as part of USBR's water rights permit under D-1422. The year-round Vernalis agricultural salinity standard of 1.0 mS/cm was met throughout 1999.

Estuarine Habitat Protection Standard

The estuarine habitat protection standard incorporates modified X2 criteria (geographic isohaline), first established in the 1994 Delta Smelt Biological Opinion. The upstream movement of a 2 ppt isohaline (2 parts per thousand of salt in the water), measured as 2.64 mS/cm at the surface, is maintained within a certain range of positions in the estuary by adequate outflow. These positions (Chippis Island or Port Chicago from February through June) are associated with fish and biota abundance.

The number of days per month when the daily averaged EC maximum (2.64 mS/cm) is in effect at Chippis Island or at Port Chicago is conditioned by the previous month's Eight River Index. This may alternately be met with a maximum 14-day running average EC of 2.64 mS/cm or with specific Delta outflow, set at a 3-day average of 11,400 cfs or 29,200 cfs, when the X2 position is at Chippis Island or Port Chicago, respectively. The Port Chicago standard becomes effective when the Port Chicago 14-day EC average immediately prior to the first day of the month is less than or equal to 2.64 mS/cm. During 1999, the Eight River Index for January through May was 2.60 million acre-feet, 4.59 million acre-feet, 3.67 million acre-feet, 3.26 million acre-feet, and 4.27 million acre-feet, respectively. The

Port Chicago 3-day average Net Delta Outflow Index standard of 29,200 cfs was met during February, March, April, and May. During the latter half of May, the 14-day EC average at Port Chicago rose above the 2.64 mS/cm standard, triggering the Chippis Island X2 objective for June. June easily met the X2 standard at Chippis Island, accruing 30 days of 14-day running mean of EC below 2.64 mS/cm.

From February through June, a wet-year habitat protection flow, measured as Net Delta Outflow, is set at 7,100 cfs and calculated as a 3-day running average. This standard may be used in lieu of the Collinsville minimum daily average or 14-day running average EC of 2.64 mS/cm. From February 1 through June 30, the 3-day running average of NDOI never fell below 8,725 cfs and averaged almost 49,000 cfs for the period, easily meeting the habitat protection NDOI minimums.

Flow Standards

D-1485 sets year-round minimum fish and wildlife flows to benefit salmon migration measured in the Sacramento River at Rio Vista between 1,000 and 5,000 cfs, using 30-day running averages. The Winter-Run Salmon Biological Opinion also sets wet-year, mean monthly flow objectives of 3,000 cfs, 4,000 cfs, and 4,500 cfs for September, October, and November to December, respectively. During these periods, the 7-day running average cannot be more than 1,000 cfs below the monthly objective. All Rio Vista flow standards were met during 1999.

The Bay-Delta Plan incorporated minimum San Joaquin River base and pulse flows from the winter-run salmon biological opinion. These are measured at Vernalis on the San Joaquin River. Base flows are set at 3,420 cfs from February to April 14 and from May 16 through June 30, if the X2 objective is required to be at the further downstream Port Chicago location. The base-flow objective is relaxed to 2,130 cfs when X2 is not required to be west of Chippis Island. The Vernalis base-flow objective was met during 1999 with the X2 objective being located at Port Chicago during February through May, while June was under the less stringent Chippis Island objective.

During wet years, the San Joaquin River spring pulse flow for April 15 to May 15 is set at a mean of 8,620 cfs at Vernalis. However, the CALFED Ops Group may vary the actual timing and duration of the pulse/attraction flow, based on real-time monitoring data. During 1999, after last-minute challenges to USBR's implementation of its Anadromous Fish Restoration Program, the SWP and CVP began using the operational objectives in the Delta Smelt Biological Opinion as export targets during the spring pulse-flow period. As a result, the combined SWP/CVP export target was set at 3,500 cfs less than the San Joaquin River flow at Vernalis. Additional water was purchased from San Joaquin River tributaries to implement a spring pulse-flow target of 7,020 cfs at Vernalis. All Vernalis base and pulse flows were met during 1999.

Net Delta Outflow Index

Delta outflow cannot be measured directly due to the tidal influence in the Delta. An approximation of Delta outflow is calculated instead, using measured inflows, exports, and estimated Delta water use. The NDOI, introduced in the 1995 Bay-Delta Plan, guided operations in 1999. It provides a more accurate method for calculating Delta outflow by including inflows of the Yolo Bypass system, the eastside stream system (consisting of the Mokelumne, Cosumnes, and Calaveras Rivers), the San Joaquin River at Vernalis, and the Sacramento Regional Treatment Plant. The NDOI-calculated flows cannot be directly compared to the Delta Outflow Index used prior to 1995, because the Sacramento River bypass flows, along with several eastside stream flows, were not incorporated into the DOI. The calculation of Delta consumptive use also differs in NDOI.

In 1999, excess outflow conditions, as defined by the Coordinated Operation Agreement, predominated for the first half of the year. Excess conditions allow greater flexibility in project operations. Balanced conditions filled out the balance of 1999. From February 8 through March 10, 1999, the outflow, calculated as NDOI, averaged almost 121,000 cfs per day. By comparison, February 4, 1998, began a 25-day period average outflow of more than 256,000 cfs and within it, a 5-day period with an average flow of more than 311,000 cfs (February 7 to 10).

The 1995 Bay-Delta Plan sets specific minimum monthly NDOI standards between 3,000 and 8,000 cfs for the protection of fish and wildlife during January and from July to December. July's wet year NDOI standard is the strictest of all months at 8,000 cfs. Monthly NDOI was highest in March at 110,043 cfs. Monthly NDOI remained above 4,000 cfs during all months of 1999, with the lowest monthly mean in October at 4,095 cfs. Additional NDOI minimums are set for the protection of striped bass from May 6 to July, usually between 10,000 cfs and 14,000 cfs. Daily NDOI values averaged 14,774 cfs for the period. All NDOI standards were met in 1999.

Export Standards

The Bay-Delta Accord conditions SWP and CVP exports, using a ratio of total Delta exports to Delta inflow, and is expressed as a maximum allowable percentage or ratio. The maximum allowable export/inflow ratio or percentage varies by month. In February, it is conditioned by the previous month's Eight River Index. During the San Joaquin River pulse flow for April to May, additional export restrictions may apply. However, WR 95-6 allowed the SWP and CVP to export at either project's pumping plants to increase fish protection, with concurrence of the CALFED Ops Group and permission of SWRCB.

The actual export amount is calculated using the 3-day average combined inflow rate for Clifton Court Forebay (excluding Byron-Bethany Irrigation District diversions from Clifton Court Forebay) added to the Tracy Pumping Plant diversion. The export/inflow ratio limit is reported as either a 3-day or 14-day running average. A 14-day running average of inflows is used unless storage withdrawals from upstream reservoirs are being made for export, in which case a 3-day average of inflows is used. In all water-year types, the February through June maximum combined export rate is 35 percent of Delta inflow; this may be relaxed in February during drier years to between 35 percent and 45 percent. From July through January, the export/inflow ratio rises to 65 percent.

During January 1999 combined SWP and CVP exports averaged only 13 percent of Delta inflow, well below the 65 percent objective, which was

partially due to a Delta fish survival test requiring a reduction in SWP exports until January 12. Exports during the more restrictive February to June period (35 percent objective) averaged only 16 percent. The highest daily combined export percentage for the period occurred on June 30, with 33.8 percent of the Delta inflow.

Exports at Banks and Tracy Pumping Plants are limited under provisions of the Bay-Delta Accord to 1,500 cfs or 100 percent of the San Joaquin River flow at Vernalis during the 30-day April 15 to May 15 pulse flow period, whichever is greater. This export limit can be used in lieu of the 35 percent export/inflow ratio only if it results in more restrictive conditions; however, during the 1999 spring pulse-flow period the SWP and CVP, under guidance from the CALFED Ops Group, used a combined export standard derived from the Delta Smelt Biological Opinion and set at approximately 3,500 cfs less than the San Joaquin River flow at Vernalis. On May 13 the SWP and CVP began operation to achieve the export rates of VAMP, a combined export of 3,000 cfs through the end of the pulse-flow season on May 17, 1999.

SWP and CVP exports were increased to 4,000 cfs on May 18, following the end of the pulse-flow requirements. However, Delta smelt salvage rose to a yellow light concern level on May 19 and reached a red light concern level on May 20, triggering consultation with U.S. Fish and Wildlife Service. Exports were reduced to 3,000 cfs to reduce the smelt salvage, but high levels of Delta smelt salvage continued through May and June, leveling off in July.

From July to December 1999 (65 percent objective), the export/inflow ratio averaged 51 percent. Exports were curtailed during December to 34 percent of Delta inflow due to an increased salinity in the south Delta. Combined exports averaged only 8 percent of Delta inflow from December 14 to 20, as exports were reduced and SWP releases to the Feather River increased to improve Delta water quality.

Banks Pumping Plant pumped a total of 16,281 cfs of CVP water February 24 to 27, 1999.

Temporary Delta Barriers

The Temporary Barriers Project began in 1991, following the 1990 release of the *South Delta Water Management Program Draft Environmental Impact Report/Environmental Impact Statement*. The program was designed to resolve local South Delta water supply issues within the larger context of the Department's water banking program. The barriers improve local water levels and circulation patterns, protect fishery resources, improve agricultural operations, and meet other South Delta Water Management Program objectives. Though originally established as a 5-year project, it was extended for an additional 5 years in 1995.

The Department was unable to obtain a permit of entry from the Reclamation District for the installation of the spring Head of Old River barrier during April, and the spring barrier was, therefore, not installed in 1999. The Head of Old River barrier was not requested by DFG in fall 1999 (a wet year) because relatively high early fall San Joaquin River flows past Vernalis had the potential to cause erosion and overtopping concerns if the barrier was constructed. The high installation and removal costs associated with a short operational timeframe made construction of the barrier impractical. The Middle River, Grant Line Canal, and Old River near Tracy barriers were installed in mid-May and were operational by June 1.

The Grant Line Canal barrier's flapgates were tied open due to high salvage of Delta smelt at the export facilities. USFWS approved operation of the flapgates on July 23, 1999. The flapgates operated inadvertently from June 23 to July 12 due to a miscommunication within the Department. The Department notified USFWS of the error on July 30 and implemented new procedures to ensure that the error would not be repeated. The Grant Line Canal, Middle River, and Old River near Tracy barriers were all breached during the last week of September 1999.

Special Study and Biological Surveys

The Department monitors dissolved oxygen levels in the Stockton Ship Channel during late summer and

early fall of each year because low dissolved oxygen levels can occur due to low inflows and warm water temperatures. Low dissolved oxygen levels can cause physiological stress to fish and block migration of salmon up the San Joaquin River. The Department also surveys benthic organism density and diversity, phytoplankton biomass, and community composition in the Sacramento-San Joaquin Delta and Suisun and San Pablo Bays (the Bay-Delta system). These surveys are conducted as a result of the monitoring mandate of D-1641.

Fall Dissolved Oxygen Conditions in the Stockton Ship Channel

Historically, dissolved oxygen levels in the eastern Stockton Ship Channel have often dropped below 5.0 mg/L during late summer and early fall because of low stream inflows, warm water temperatures, high biochemical oxygen demand, reduced tidal circulation, and intermittent reverse flow conditions in the San Joaquin River downstream of Stockton. These low dissolved oxygen levels can cause physiological stress to fish and block upstream migration of salmon.

The Department usually closes the Head of Old River by installing a temporary rock barrier (the Old River closure) during periods of projected low fall outflow. The closure increases net flows in the San Joaquin River downstream of Stockton and helps alleviate dissolved oxygen concerns in the eastern channel. In 1999, however, the Department did not install the closure because water year 1999 was classified as wet, and San Joaquin River flows below Vernalis throughout late summer and early fall approached or exceeded 2,000 cfs. These relatively high flows, which could potentially cause erosion and overtopping concerns if the closure were constructed, were projected to be enough to minimize reverse flow conditions past Stockton.

Average San Joaquin River flows below Stockton ranged from -392 to +352 cfs from August through October and resulted in low river inflows into the eastern Stockton Ship Channel. These low inflows apparently contributed to a dissolved oxygen sag (an area where dissolved oxygen levels are 5.0 mg/L or less) throughout most of the monitoring period. The sag was present from the eastern end of Rough and

Ready Island in the eastern channel to Fourteen Mile Slough in the central channel and extended west to Turner Cut in the central channel on October 25, 1999. Relatively warm water temperatures measured within the channel in August and early September (21 to 26 degrees C), high biochemical oxygen demand, and low inflows apparently contributed to the late summer and early fall dissolved oxygen sag in the central and eastern portions of the Stockton Ship Channel.

As in previous years, dissolved oxygen concentrations from Prisoner's Point to Disappointment Slough in the western channel were relatively high and stable throughout the study period. Dissolved oxygen values ranged from 7.7 to 10.0 mg/L during the August 10 to December 7 study period. The robustness of dissolved oxygen concentrations in the western channel is likely due to greater tidal mixing and the absence of conditions creating excessive biochemical oxygen demand in this portion of the channel.

Unlike previous years, dissolved oxygen concentrations did not recover to levels more than 6.0 mg/L in the central and eastern channels in late fall (November and December) despite slightly improved inflow conditions and markedly cooler water temperatures (10 to 14 degrees C). During this period, dredging, resuspension of sediments, and increased biochemical oxygen demand in the central channel were sufficient to offset recovery to the historical levels previously recorded.

Benthic Monitoring

The benthic monitoring program documents changes in the composition, abundance, density, and distribution of the benthic (bottom dwelling) biota within the Bay-Delta. Benthic biota are relatively long-lived and can respond to environmental changes such as fresh water inflows, salinity, and substrate composition. As a result, benthic data can provide an indication of physical changes occurring within the Bay-Delta. Because operation of the SWP can impact flow characteristics and subsequently influence the density and distribution of benthic biota, benthic monitoring is an important component of the Compliance Monitoring Program. Benthic monitoring

data are also used to detect and document the presence of newly introduced species.

Benthic monitoring is conducted at ten sampling sites representing the major habitat types within the system. Department staff collect four bottom grab samples and one sediment sample monthly at all sites. The grab samples are analyzed in the laboratory to identify organisms to genus (and to species when possible) and to determine the density of all organisms collected. Sediment samples are analyzed to determine substrate composition.

As a result of this environmentally diverse sampling, 11 new organisms were added to the benthic species list in 1999. The following species were collected at San Pablo Bay (a saline to brackish-water site west of the Delta):

- an isopod, *Caicidotea racovitzai*, in January
- a sea spider, *Achelia nudiuscula*, in September
- an amphipod, *Stenothoe valida*, in October
- the polychaete worms, *Amaeana occidentalis* and *Polydora socialis*, in October and November, respectively
- a copepod, *Pygodelphys sp.*, in November
- an unidentified nudibranch, in November, and
- a basket cockle, *Clinocardium nuttallii*, in December

The following insect species were collected at the Sacramento River at Rio Vista (a fresh-water site in the western Delta):

- the riffle beetle, *Microcylloepus sp.*, in February, and
- the dipteran *Bezzia sp.*, in April

The oligochaete, *Kincaidiana freidris*, was collected in April at Rock Slough near Old River (a fresh-water site in the southern Delta).

Of the 160 species of benthic macrofauna collected in 1999, nine species represented approximately 89 percent of all organisms collected. These nine species include

- the amphipods, *Corophium stimpsoni*, *Corophium spinicorne*, *Ampelisca abdita*, and *Gammarus daiberi*

- the aquatic oligochaetes, *Varichaetadrilus angustipenis* and *Limnodrilus hoffmeisteri*
- the cumacean or fresh water crustacean, *Nippon-leucon hinumensis*, and
- the Asian clams, *Potamocorbula amurensis* and *Corbicula fluminea*

Corophium stimpsoni and *Ampelisca abdita* each represented 16 percent of the total organisms collected and were the most abundant species collected in 1999.

Of the nine dominant species, *Ampelisca abdita* and *Potamocorbula amurensis* represent macrofauna that inhabit a more saline environment and were found in San Pablo Bay, Suisun Bay, and Grizzly Bay. *Nippon-leucon hinumensis*, which tolerates a wider range of salinity, was collected in both the saline western sites and the brackish-to-fresh-water eastern sites—the San Joaquin River at Twitchell Island and the Sacramento River above Point Sacramento. The remaining six species are predominantly freshwater species and were collected at sites east of Suisun Bay.

Phytoplankton Monitoring

Average monthly chlorophyll *a* concentrations throughout much of the Bay-Delta system were low; 77 percent of the stations sampled in 1999 had levels below 4 mg/L (baseline levels). The maximum chlorophyll *a* concentration for most stations was reached during April or May, followed by another, smaller peak in late summer or early fall. The maximum chlorophyll *a* concentration of 36.6 mg/L was reached during mid-summer in the south Delta at Vernalis. This peak, well above the high of 22.1 mg/L recorded in 1998, occurred when water temperatures were high and fresh water inflows were low. Concentrations of chlorophyll *a* west of the Delta in Suisun and San Pablo Bays were low, only reaching a maximum of 3.16 mg/L. Low chlorophyll *a* concentrations in these bays could be a result of extensive filtration of the water column by the introduced Asian clam, *Potamocorbula amurensis*. Well-established benthic populations of *P. amurensis* in this region probably contributed, by grazing on phytoplankton and subsequently suppressing chlorophyll biomass, to the low chlorophyll *a* concentrations (and increased water clarity) measured in the bays since the mid-1980s.

Percent chlorophyll *a* is the proportion of chlorophyll *a* in total chlorophyll *a* and pheophytin *a* (a breakdown product of chlorophyll *a*) and is an indicator of phytoplankton activity. The percent of chlorophyll *a* concentrations in spring and early summer 1999 were well above 50 percent at all monitoring sites, indicating that plankton were growing well throughout the Bay-Delta system during this period.

Melosira granulata and *Cyclotella sp.* were the most common species in the mid-Delta region. *Cyclotella sp.* and miscellaneous flagellates were the most common species in the San Pablo region west of the Delta. *Melosira granulata*, *Cyclotella sp.*, and *Skeletonema costatum* were the most common species present during the spring blooms throughout the Bay-Delta.

Activities Outside the Delta

Activities conducted outside the Delta include scheduled routine SWP water quality monitoring as well as special studies. Most of these special studies are in response to fish and wildlife and water quality issues of importance to agencies that provide domestic water supply. These agencies face increasingly stringent regulations and look to the SWP to deliver high quality raw water.

Water Quality Monitoring

The Division of Operations and Maintenance collects detailed water quality information on the concentration and distribution of chemical, biological, and physical parameters at 33 aqueduct and reservoir sites located throughout SWP facilities. Stations are situated south of the Delta at reservoirs, pumping plants, power plants, and check structures of the South Bay, Coastal Branch, and California Aqueduct. Other monitoring activities are conducted on the North Bay Aqueduct, Feather River, and at State reservoirs north of the Delta—Lake Oroville, Antelope Lake, Frenchman Lake, and Lake Davis.

The Water Quality Program of the SWP was established in 1968 with completion of the California Aqueduct. More than 60 different chemical constituents are monitored monthly, quarterly, or annually. In addition, automated stations are maintained for continuous monitoring of aqueduct water.

The Department maintains an analytical laboratory (Bryte Laboratory in West Sacramento), which processes most SWP laboratory water quality assessments. The Department also contracts for some laboratory services. Water samples from 15 SWP stations are analyzed monthly to determine levels of dissolved solids and concentrations of nutrients, chloride, sulfate, sodium, trace metals, and other constituents. Herbicides, pesticides, organic substances, and phytoplankton are monitored less frequently.

Selected SWP water quality data are available electronically through the Department's internet home page at www.wmq.water.ca.gov and reported monthly in the State Water Project Operations Data Report. Table 4-1 presents laboratory results of sampling at several representative stations during 1999.

Delta exports are normally the primary source of water in SWP facilities and reservoirs south of the Delta. Most Delta water is exported south during the winter and spring when the greatest freshwater outflow occurs; as a result, reservoirs south of the Delta are usually supplied with the highest quality water. San Luis Reservoir, the only SWP conservation storage facility between the Delta and Southern California, is usually filled by May 1.

Municipal Water Quality Investigations Program

The Sacramento-San Joaquin Delta provides drinking water for over 22 million people in California. Because the Delta is a relatively unprotected watershed, water quality degradation is possible from many sources, including industrial and municipal wastewater discharges, storm water runoff from cities, agricultural discharges, recreational activities, abandoned mines, and illegal dumping. The Municipal Water Quality Investigations Program was established to evaluate the suitability of Delta water as a drinking water source, to identify sources of water quality degradation, and to evaluate means of eliminating or preventing degradation of Delta water quality.

Participants in the program include CCWD and the municipal water contractors of the SWP. Program advisors include representatives of participating

**Table 4-1

agencies, including the EPA, Department of Health Services, and California Urban Water Agencies. Because water quality concerns change rapidly with new drinking water regulations and water quality issues, the MWQI Program must be flexible enough to adapt to changing requirements. The former Delta Health Aspects Monitoring and Delta Island Drainage Investigations Programs merged into the MWQI Program in 1990; the program continues to evolve.

The program's initial focus was to compile a comprehensive database on quality of drinking water in the Delta. Since then, the program has investigated ways of managing Delta lands and waters to minimize adverse impacts on drinking water quality. It has also identified sources of contaminants in the Delta and assessed their significance for drinking water quality and water treatment. Drinking water standards are more difficult to meet when natural organic materials from agricultural drainage are involved.

In addition to monitoring water quality in the Delta, the program now includes studies on source water improvement and management. Several studies developed and tested possible solutions to drinking water problems of the Delta and other watersheds of the SWP.

As required by DHS, a 5-year update of the sanitary survey of the SWP was completed in 1996, resulting in the *California State Water Project Sanitary Survey Update Report 1996*. This survey documented water quality conditions and identified potential sources of contamination within the SWP and its watersheds. In addition, the report included recommendations for further investigations and corrective actions. Based on these recommendations, activities and investigations within the MWQI Program continue to address these water quality issues. Program staff began writing the 2001 sanitary survey update in fall 1999. This document will focus on recreation, pathogens, and dairy issues. It is scheduled for completion in early spring 2001.

The 1996 sanitary survey identified the North Bay Aqueduct/Barker Slough Watershed as having the most challenging water quality conditions in the SWP. Water quality problems identified within this watershed included high levels of turbidity and

microbial (microorganisms) contaminants, as well as high concentrations of organic carbon.

The North Bay Aqueduct/Barker Slough Watershed Study was started to investigate these problems. The study was initially divided into two phases. Phase I began July 1, 1996, and continued until July 1997. The results were published in *The North Bay Aqueduct Barker Slough Watershed Water Quality Phase I Report*. Phase II began after all sampling for Phase I was completed and reviewed by the Department and the North Bay Aqueduct Technical Advisory Committee. Phase I was designed to quantify water quality constituents at the screening level. Results showed that the upper Barker Slough Watershed was a potentially significant source of contaminants during the wet season. Phase II was designed to further investigate specific pollutants in the upper watershed where runoff is high during the wet season and to collect hydrological data when possible. Results showed that the upper watershed contributes a significant amount of organic carbon and turbidity to Barker Slough during storms. This has been linked to operational challenges for North Bay Aqueduct-supplied treatment plants during these periods.

Based on these findings, the Solano County Water Agency applied for and received a SWRCB 305(J) grant to work with landowners in the watershed to address these loading issues. Phase III, which began in fall 1998, linked the use of auto samplers with automatic hydrological monitoring stations to allow data and water samples to be collected during peak runoff events. The goal was to create mass load calculations at three locations in the watershed. Results from this study have shown that the watershed loads large amounts of carbon during peak runoff periods into Barker Slough, and that the carbon is not easily flushed out of the system. A University of California, Davis investigation of the soils has shown that they contain high sodium, which leads to easier dispersion during runoff periods, creating high turbidity and carbon levels. Currently, the stakeholders are investigating the feasibility of best management practices to reduce carbon and turbidity in the slough. The MWQI Program will continue to work with the stakeholders to provide water quality technical assistance to the project.

In response to another recommendation of the 1996 sanitary survey report, the MWQI Program implemented a Coordinated Pathogen Monitoring program for the SWP and the Delta, in coordination with the Division of O&M and the Metropolitan Water District of Southern California. This monitoring program began in fall 1996 and continued through April 1998. The program evaluated the microbiological status of SWP source waters for protozoans and bacteria using the EPA Information Collection Rule methodology. Additional work was conducted to evaluate the EPA Method ICR sampling and analysis methodology used for the study. Results from the 18-month sampling study and the methodology evaluation study were published in the 1997-98 MWQI annual report.

In fall 1999, the MWQI Program began assessing EPA method 1623, a new EPA-approved sampling methodology for protozoans. The study will continue into winter 2000.

Other components of the MWQI Program include

- installation and testing of new instrumentation to provide real time water quality data to describe Delta water quality in terms of concentrations, sources, and loads;
- evaluation of proposed CALFED restoration actions in terms of drinking water impacts;
- working with the California State and regional water quality control boards to develop drinking water policy as part of the basin plan; and
- investigation of new and increasing sources of pollution, including urban sources.

Collectively, these and other MWQI studies and activities are designed and conducted to address major water quality and water supply issues, such as the Delta's ability to meet user needs, adjust to stricter State and federal regulations, and provide reliable, clean water supplies in the future. Each study or activity serves to discover, test, and assess possible solutions to problems in the Delta and other watersheds of the SWP and assures that future demands for safe, potable water supplies can be met.

Bryte Chemical Laboratory

Bryte Chemical Laboratory, established in 1951, continues to perform the majority of chemical and other related analyses needed to support the Department's water quality programs. Thousands of water samples are analyzed for minerals, nutrients, metals, pesticides, and other constituents. Bryte Chemical Laboratory continues to manage all analytical contracts with outside laboratories according to the master contract policy approved in fiscal year 1994-95. The laboratory continually works with the Quality Assurance/Quality Control Section to replace contracts that expire each fiscal year.

Analytical procedures and methods are continually updated and evaluated by the laboratory and several new methods are being added to the laboratory's list of available services. Solid-phase extraction for oil and grease EPA Method 1664 has been validated and is now routinely being performed. Several other solid-phase extraction methods are currently being evaluated for semi-volatile organic compounds, which include pesticides and herbicides. The new solid-phase extraction procedures will result in both time and cost savings for the laboratory. Bryte Chemical Laboratory is also in the process of adding EPA Method 218.6, an ion chromatography method that will be required for drinking water involving the analysis of chromium. This new method will be available January 1, 2001, and will allow chromium to be reported to 1 part per billion for all SWP-related programs.

The laboratory purchased several new analytical instrument systems during 1999 to modernize and expand its capabilities. A new automated Dionex Ion Chromatograph DX 500 system was purchased to combine several methods used to analyze fluoride, chloride, sulfate, nitrate, and bromide into one analytical method, EPA Method 300. This new system will save labor, time, and reagent costs. The laboratory also replaced an outdated Inductively Coupled Plasma Emission Spectrometer that was no longer cost effective. The new system is a Perkin Elmer ICP Optima 4300 DV. It is a fully automated computer-controlled system that can operate unattended overnight. The new system has lower detection limits,

faster analysis time, greater sample capacity and also has QA/QC functions built into its operating system software.

The Field and Laboratory Information Management System, implemented in 1997, has continued to enhance the laboratory's data management capabilities. This system simplifies the transfer process by allowing electronic transfer of samples for analysis to the laboratory. It provides users with information on all analytical services available through Bryte Laboratory, including costs. It also provides users with sample requirements for each analysis requested, such as types of containers needed, sample volumes necessary, and the type of sample preservation required. The system is designed to store all current analytical data, including all required QA/QC data pertaining to sample analysis. It is designed to log, track, and assign sample analyses to the appropriate chemist in the laboratory. FLIMS will generate the final reports to the requestor in hard copy and electronic format.

Quality Assurance/Quality Control

The QA/QC Program, established in 1992, ensures that data produced by the Department's annual multi-million dollar investment in environmental monitoring activities meets high quality standards and is also scientifically defensible.

The QA/QC Program actively ensures that in-house and contract laboratories providing analytical services for the Department comply with QA/QC procedures, standards, and requirements. The QA/QC Program

- periodically submits performance evaluation samples to all in-house and contract laboratories to evaluate their performance;
- conducted a study evaluating the characterization of organic carbon by ultraviolet absorbance spectrophotometry;
- continued the QA/QC review of incoming environmental data for programs within the Water Quality Assessment Branch of the Division of Planning and Local Assistance;
- continues using FLIMS at Bryte Laboratory; and
- enlisted California State University, Chico to begin development of the water quality module

of the water data library; this database will house all of the electronic data from Bryte Laboratory and eventually all Department water quality data.

Other services provided by the QA/QC Program include helping other Department programs develop quality assurance project plans, evaluating QA/QC data to determine the accuracy and precision of environmental data, and testing and evaluating the performance of environmental monitoring equipment. Ongoing assistance is provided to all departmental environmental monitoring programs, including those within DPLA, O&M, Environmental Services Office, and the Interagency Ecological Program.

The QA/QC Program also conducts research into new methods and procedures used by analytical laboratories and evaluates new types of field equipment for sampling or analysis. These research activities include developing and implementing analytical protocol for simulated distribution system testing for trihalomethanes and haloacetic acids, stability of organic carbon concentrates in samples obtained by autosamplers, and an on-line real-time total organic carbon autoanalyzer.

Quality Assurance/Quality Control

The water-related data collected by the Department must be scientifically supportable. To help protect the Department's large investment in water-related data, the Quality Assurance/Quality Control Program was created in 1992. Under the QA/QC Program, guidance documents are published, training courses are implemented, and technical support is provided to managers of water data collection programs throughout the Department.

In addition to its basic mission of supporting and strengthening the validity, integrity, and credibility of water data collected by the Department, the QA/QC Program also provides leadership in efficient planning and execution of data collection activities. To minimize cost, it is necessary to carefully plan, implement, interpret, and evaluate data collection activities. Good data collection programs begin with identifying the data collection goal and establishing the data quality objectives to meet the goal. This planning is done before actual data collection and assures that the correct type and amount of data are collected to meet program objectives. Through this process, the Department avoids collecting inadequate, irrelevant, or extraneous data, and thereby avoids waste.

Suisun Marsh Activities

The Suisun Marsh

Suisun Marsh is about 59,000 acres of tidal and managed brackish water wetlands and 30,000 acres of bays and sloughs. It is the largest contiguous estuarine marsh remaining in the United States. Situated in southern Solano County, west of the Sacramento-San Joaquin Delta and north of Suisun Bay, the marsh encompasses more than 10 percent of California's remaining natural wetlands. In addition, the marsh is the resting and feeding ground for thousands of waterfowl migrating on the Pacific Flyway.

Since the early 1970s, the California Legislature, SWRCB, USBR, DFG, Suisun Resource Conservation District, the Department, and other agencies have focused on preserving the Suisun Marsh as a unique environmental resource. As part of its responsibility for protecting Suisun Marsh, SWRCB included water quality standards for the marsh in Term 10 of SWRCB D-1641, which applies to SWP and CVP operations. D-1641 was adopted by SWRCB on December 29, 1999. In 1987, the Department, USBR, DFG, and SRCD signed the Suisun Marsh Preservation Agreement (see sidebar below). SMPA contains provisions for actions to control channel water and soil salinity to mitigate impacts of

the SWP, CVP, and other upstream diverters on managed wetlands in Suisun Marsh.

Suisun Marsh Preservation Agreement Activities

In July 1995, USBR, DFG, SRCD and the Department began negotiations to amend the Suisun Marsh Preservation Agreement to reflect the current condition in the marsh. The parties agreed that: (1) the additional large-scale facilities proposed in the Plan of Protection are not necessary for salinity control in Suisun Marsh because of effectiveness of the Suisun Marsh Salinity Control Gates in conjunction with the additional outflows specified in the 1995 Bay-Delta Plan; and (2) supplemental actions are needed to better achieve the objectives of SMPA.

Amendment Three Actions. SMPA was amended in July 1995 to provide equal or better protection to Suisun Marsh-managed wetlands as intended under the original agreement and also to make channel water salinity standards consistent with SWRCB's 1995 Water Quality Control Plan. In addition, Amendment Three incorporates channel water salinity standards in the marsh similar to those under the original agreement and consistent with SWRCB's terms and conditions in the Department's and USBR's water rights permits for the SWP and CVP.

Suisun Marsh Preservation Agreement

In 1986, federal legislation (Public Law 99-546) authorized funds to USBR to protect Suisun Marsh. On March 2, 1987, the Department, USBR, DFG, and SRCD signed the Suisun Marsh Preservation Agreement. The objective of SMPA is to assure that USBR and the Department mitigate for any adverse effects of the Central Valley Project and State Water Project on managed wetlands in the marsh, as well as a portion of the adverse effects of other upstream diversions. Under the original agreement, this objective is primarily accomplished by constructing large-scale facilities in the marsh to maintain a dependable supply of adequate quality water within Suisun Marsh channels. A component of the large-scale facilities is the Suisun Marsh Salinity Control Gates facility, which began operating in November 1988.

On August 4, 1995, the Suisun Marsh Coordinators, representing the four agencies party to SMPA, began discussions directed at updating the agreement, pursuant to SMPA Articles 4 and 17. Representatives from USBR, the Department, DFG, and SRCD established an ad hoc Negotiating Team, Technical Group, Drafting Committee, and Environmental Documentation Team. Beginning September 1995, the SMPA Negotiation Team met monthly in Sacramento and made significant progress in developing the basis to amend the agreement. Representatives from the SWP and CVP contractors actively participated in the negotiations. Updating SMPA will reflect future hydrologic and salinity conditions in the Suisun Marsh as prescribed by the SWRCB 1995 Water Quality Control Plan and will place more emphasis on improving water and land management practices and facilities on managed wetlands. The SMPA parties will sign Amendment Three after completing CEQA and NEPA documentation and CESA and ESA consultations.

Proposed Amendment Three management actions include

- meeting channel water salinity standards in WR 95-6 (now D-1641);
- converting S-35 and S-97 from compliance stations to monitoring stations;
- setting criteria for September operation of the salinity control gates;
- implementing a water management program;
- updating existing management plans;
- implementing a joint-use facilities program;
- establishing managed wetland improvement cost-share funds;
- providing portable diversion pumps with fish screens;
- providing portable drainage pumps;
- realigning and stabilizing Roaring River distribution system turnouts; and
- establishing a drought response fund.

Environmental Review and Consultation Status.

The following activities were completed in support of SMPA Amendment Three:

- informal ESA consultation completed with NMFS in 1998. Project description modified to include adult salmon passage study at SMSGC;
- DFG rendered draft biological opinion, June 1998;
- draft CEQA/NEPA document distributed for public comment, June 1998;
- final biological assessment submitted to USFWS, October 1999;
- consolidated formal ESA consultations for Amendment Three and the renewal of the SRCD/DFG regional general permit for maintenance activities. The permit is required for implementing Amendment Three actions; and
- USBR and U.S. Army Corps of Engineers jointly initiated formal ESA consultation, October 1999.

SMPA Environmental Coordination Advisory

Team. The SMPA Environmental Coordination Advisory Team was convened to ensure compliance with conditions, mitigation, and monitoring responsibilities specified in SMPA. ECAT includes staff from the Department, USBR, DFG Grizzly Island, DFG Central Valley Bay-Delta Branch, and SRCD. USFWS, NMFS, and the Corps' staff have partici-

pated on ECAT in an advisory role. ECAT documents compliance with biological opinion measures and permit terms and provides reports to SMPA coordinators.

At ECAT's monthly meetings during 1999, discussions included SMPA Amendment Three and Section 7 consultation, Morrow Island fish screen alternatives, Suisun Marsh monitoring efforts, and property acquisition for tidal marsh restoration. Monitoring plans for the marshwide vegetation survey, Island Slough, and salt marsh harvest mouse were developed and approved through ECAT.

Individual Ownership Cost Share Program. The Individual Ownership Cost Share Program is a component of SMPA and is designed to assist individual landowners with water management on privately owned land within Suisun Marsh. The program includes replacing, lowering, and/or enlarging drainage structures and the purchase of pumps to assist drainage. The program began in 1987 with a 50-percent reimbursement by the Department and USBR. Participation in the program has greatly increased since 1994, when SMPA coordinators retroactively increased departmental and USBR reimbursement to 75 percent.

Three applications for water management projects were submitted and paid for during 1999. The total cost of these improvements was \$53,482, of which \$40,111 was paid to SRCD and distributed to the landowners. The Department and USBR received and paid for seven additional 1999 applications. The Department and USBR have paid a total of \$1,203,825 since the program began in 1987.

The Department and USBR added an additional \$57,802 to the Individual Ownership Cost Share Program to account for inflation as specified in the original SMPA. SRCD anticipates that the remaining program funds will be exhausted by the time projects are completed October 2001.

Suisun Ecological Workgroup

In the 1995 Bay-Delta Plan, SWRCB directed the Department to convene an interagency work group to evaluate the technical basis of the Suisun Marsh water quality objectives and their effects on

beneficial uses. Consequently, SEW was formed to recommend salinity objectives to protect the beneficial uses of Suisun Marsh. Staff from SWRCB, SRCD, DFG, USBR, USFWS, and the Department have actively participated in the workgroup.

In 1996, SEW became a project work team under IEP. The purpose was to encourage other technical experts working on related topics in the estuary to provide input to SEW and to facilitate interagency review of SEW's work. SEW established a Web site to post meeting summaries, work plans, and products through IEP's Web site at iep.water.ca.gov/suisun_eco_workgroup/.

In 1999, SEW focused on completing its final report, which was reviewed by IEP. The final report will be submitted to SWRCB by January 2002. SWRCB plans to hold public meetings to receive comments on the final report following receipt of the report.

A draft final report is currently posted on the Web site and will be replaced by the final report after completion.

Modeling Support

Suisun Marsh Planning Support for the CALFED Levee Investigation Team

The CALFED Bay-Delta program established the Suisun Marsh Levee Investigation Team to gather information on the costs and benefits of including Suisun Marsh levees in the CALFED program, especially as they relate to CALFED water quality, water supply reliability, and Ecosystem Restoration Program goals. The Suisun Marsh Planning Section supported the team by using the Department's Delta Simulation Model 1 to evaluate hydrodynamics and salinity impacts of controlled and uncontrolled levee breaches in Suisun Marsh.

Suisun Marsh Planning Participation in the Project Work Team

The IEP Delta Simulation Model 2 Project Work Team is nearing completion of a multi agency cooperative effort to recalibrate the DSM2 model. Recalibration efforts began in August 1999. The project work team activities include

- collection of new Bay-Delta channel geometry data;
- collection of flow data at strategic Delta locations;
- model testing and sensitivity analysis;
- preparation of calibration protocols; and
- active participation in calibration activities among participants.

Geometry data is available to the public at www.iep.water.ca.gov/dsm2pwt/geometry/. Flow data is available at www.iep.water.ca.gov/dss/. Project work team participation in the calibration is facilitated by using www.iep.water.ca.gov/dsm2pwt/. The Web site contains near real-time access to daily calibration run output and a facility for interactive comments on each calibration run.

Participants in the calibration effort include staff from the Department's ESO, DPLA, and O&M; USBR; USGS; University of California, Berkeley; Stanford University; CCWD; and MWD. The process is unique—a virtual interagency collaboration on calibration of a complex hydrodynamics and water quality model. The potential benefits include creating an accurate model and generating trust and understanding about the cooperative process. The team is working toward a September 2001 deadline for completion of the calibration.

Suisun Marsh Technical Advisory Committee

In 1999, Department staff facilitated four quarterly Suisun Marsh Technical Advisory Committee meetings. The quarterly meetings, which provide an overview of current activities in the marsh, were attended by representatives from federal, State, and local agencies. Since October 1999, the committee meeting agenda and minutes have been posted on the Internet at www.iep.water.ca.gov/suisun/.

Operation and Maintenance

Suisun Marsh Salinity Control Gates

The Suisun Marsh Salinity Control Gates are operated from October 1 through May 31, as needed to meet salinity standards; otherwise they are placed in an open position to minimize fish concerns related to predation and impedance. In the past, the gates' operation and installation or removal of the flashboards

has varied due to salinity conditions, fisheries agency requests for sensitive species concerns, or special studies and repairs.

The 1998-99 SWRCB Annual Report included discussion on the first half of the control season for the gates. Since marsh conditions were relatively fresh from November 13, 1998, through May 1999, minimal use of the gates during the second half of the control season was required. Although gate operations were not needed to control salinity during the second half of the control season, the modified flashboards were installed for data collection purposes until removal on April 7, 1999.

The gates were closed for several hours on February 3, 1999, to measure current velocity through preliminary flashboard modifications. The velocity test was conducted to determine a relationship between velocity and stage under tidal flow conditions through the modified flashboards for modeling and fish passage analysis.

From September 1 through November 9, 1999, the gates' operation was tailored to the adult salmon passage study conducted jointly by the Department, USBR, DFG, SRCD, and NMFS.

After completion of the 1999 fall fish passage study, the gates were operated from November 10, 1999, to December 31, 1999, to meet salinity standards as a good faith effort by the Department, despite SWRCB approval of a variance on the standards during the 3 years of fish passage tests. The gates were operated with the modified flashboards installed. This configuration was specified in the fish passage study, which also facilitated gathering more salinity data.

At the end of the fish passage test, mean high tide salinity conditions at all marsh compliance sites ranged from 16.0 to 17.0 mS/cm, eastern to western, respectively. The gates were operated to lower and control salinity throughout the marsh. Within 1 to 2 days, the gates' operations lowered mean high tide salinity at all eastern compliance sites (S-49, S-64, and C-2) by about 1 mS/cm per day and salinity dropped daily until the end of November. Operation of the gates also lowered mean high tide salinity at western marsh compliance sites (S-42 and S-21); however, the response time took about 3 to 5 days due to the sites' greater distance from the gates.

Morrow Island Distribution System Maintenance. In summer 1999, the Department completed the modifications of the Morrow Island Distribution

Plan of Protection for Suisun Marsh

The Plan of Protection for Suisun Marsh, published under the requirements of SWRCB Decision 1485, was designed to ensure that D-1485 standards are met. The plan contained a proposal to monitor water quality; develop management plans for managed wetlands; install, in phases, physical facilities to control channel water salinity for interior marsh sloughs; and provide mitigation for construction impacts associated with physical facilities.

The plan also included a programmatic environmental impact report that discussed actions identified in the plan and the effects of each action. According to the plan, the Department and USBR, as lead agencies, would prepare supplemental environmental documentation if new significant impacts were identified during the planning and implementation of subsequent actions.

The Plan of Protection suggested six phases to provide salinity control for the Suisun Marsh. Phase I (Initial Facilities) and Phase II (Suisun Marsh Salinity Control Gates) are complete. In 1990, Phases III and IV, directed at the western Suisun Marsh, were combined and identified as the Western Suisun Marsh Salinity Control Project. Discussions about Phase V, the Grizzly Island Distribution System, were initiated with SRCD in 1993. The Potrero Hills Ditch was identified as Phase VI. In 1995, the Department, USBR, DFG, and SRCD agreed that the additional large-scale facilities in Phases III through VI are not necessary for salinity control in the Suisun Marsh because of the Delta hydrology resulting from implementation of the 1995 Bay-Delta Plan and the effectiveness of the Suisun Marsh Salinity Control Gates. The parties arrived at this decision based on data collection during control gates operation and departmental model studies conducted in support of the 1995 Bay-Delta Plan and EIR for its implementation as described in this section.

System. The ditch levee road was widened and the wing-walls of the outfall straightened.

Planning, impact analysis, and permit acquisition for the installation of the MIDS intake fish screens continued in 1999. The fish screens, originally required by the biological opinion for the project, serve to protect sensitive fisheries in the area.

Roaring River Distribution System Maintenance.

The Roaring River distribution system was completed and became operational in 1980. Fish screens were installed and tested on two intake culverts in 1980 and on the remaining six culverts in 1983. In 1997, the slide gates on the eight intake culverts were automated to maintain the 0.2 feet per second maximum approach velocity of USFWS fish screen criteria.

During summer 1999, maintenance was conducted on sections of the levees to restore the entire Roaring River levee system to the original design specifications. All the environmental clearances were obtained by June 1999. The contractor began work on July 14 and completed work on August 31; a Notice of Completion was sent to the regulatory agencies on September 13, 1999. Repairs consisted of

- installing geofoam at two levee sites;
- raising the levees to their original design heights;
- widening the levee roads to a constant width of 15 feet;
- placing aggregate base on most of the north and south levee roads; and
- placing rip-rap at erosion-prone banks.

Suisun Marsh Levees

Sunrise Club Levee Breach/Wave Wash Protection

A levee breach occurred at Sunrise Club (Club 405) during August 1999. The breach occurred along Frank Horan Slough on Club 405's southern levee and resulted in the complete flooding of Club 405 and exposure of the interior of levees to tidal action and wave erosion. The breach also affected tide and salinity conditions at compliance station S-21 through tidal damping. Station S-21, shown in Figure 4-2, is located on Chadbourne Slough just east of Club 405.

Monitoring

Comprehensive Review of Suisun Marsh Monitoring Data

The Suisun Marsh Preservation Agreement and the Suisun Marsh Monitoring Agreement were signed in 1987 and outlined a monitoring program for data collection in the Suisun Marsh. Monitoring was conducted from water years 1985 through 1995. These agreements also stipulated that the monitoring data and the effectiveness of the agreements were to be reviewed every 5 years. This review was not completed in 1992, and a comprehensive review of all the monitoring data began in 1996. The monitoring program included channel water salinity, water quality, and pond stage data from managed wetlands in the marsh, vegetation monitoring, and wildlife surveys. Review of the draft report was completed in 1999 and the final report is expected to be released in fall 2001.

Water Quality Monitoring and Compliance

Suisun Marsh channel water salinity standards were specified in SWRCB WR 98-9 for seven compliance stations. Four of these—National Steel (S-64), Bel-dons Landing (S-49), Volanti (S-42), and Sunrise (S-21)—are located within the marsh. A fifth—Collinsville (C-2)—is located in the western Delta. The Department requested that the two remaining sites located in the western marsh—Morrow Island (S-35) and Ibis (S-97)—be converted to monitoring stations because of the SWP's minimal control on salinity levels at these locations. SWRCB D-1641, dated December 29, 1999, granted an exemption from the compliance monitoring requirement for these stations. Both remain active, however, as water salinity monitoring stations.

Salinity levels remained well within compliance during the period—October 1, 1998, through May 31, 1999—due mostly to sustained relatively high Delta outflow. See the Department's annual report to SWRCB, *Suisun Marsh Monitoring Program Data Summary: 1999 Water Year*, for details.

Water Quality Monitoring for the SMSCG Salmon Passage Study

Water quality monitoring efforts were conducted in fall 1999 to determine if dissolved oxygen and water

temperature conditions in Montezuma Slough could affect the movement of salmon in Montezuma Slough during the study period.

Salmon Tagging Crew Water Quality Monitoring. DFG and the Department's salmon-tagging field crews conducted water quality measurements at 3-hour intervals for about 14 hours per day on September 14 through 15, September 30 through October 2, and October 18 through 22, 1999. Crews measured dissolved oxygen, water temperature, and specific conductance.

Results from this portion of the study are anticipated in February 2001.

Water Quality Profiling. Water-quality profiling was conducted along Montezuma Slough on September 24, October 4, and October 20, 1999. Each profiling session coincided with an individual study/gate operation phase.

Somewhat depressed dissolved oxygen concentrations were detected during the October 20, 1999, profiling session at several stations along the Grizzly Island Wildlife Area, downstream of the control gates. The cause of the depressed dissolved oxygen concentrations is unknown but may be related to the discharge of drainage water from managed wetlands into Montezuma Slough.

Continuous Water Quality Measurements at Monitoring and Compliance Stations S-71 and S-64. Measurements for specific electrical conductivity, temperature, and dissolved oxygen were taken at every 15-minute interval around-the-clock at Suisun Marsh monitoring station S-71 and compliance station S-64 during the 1999 study. The stations are located along Montezuma Slough, as shown in Figure 4-2.

Somewhat depressed dissolved oxygen concentrations were detected in Montezuma Slough at monitoring station S-71 while the YSI 6600 was deployed at the station. Depressed dissolved oxygen concentrations were also detected at monitoring station S-64 from about October 15, 1999, until the end of dissolved oxygen monitoring operations at the station on November 3, 1999.

Monitoring Station Maintenance, Repair, and Enhancements

Routine maintenance, repair, and enhancement activities for Suisun Marsh monitoring stations during water year 1998-99 included

- flushing of tide wells to remove accumulated sediments;
- clearing/trimming of encroaching vegetation;
- repairing and resetting of staff gauges;
- calibrating monitoring instruments;
- quality control and assurance of collected data;
- surveying the station elevation; and
- replacement of expanded probe floats with plastic floats to protect fish from possible ingestion hazards.

Additional routine activities included minor repairs to monitoring stations and monitoring equipment.

Nonroutine maintenance and repair activities included

- reinforcement and modification of walkway and building supports for station S-64 (National Steel);
- walkway reconstruction and partial removal of the stilling well at station S-97 (Ibis);
- stilling well repair at station C-2 (Collinsville);
- installation of a new data logger housing at station S-37 (Godfather II); and
- installation of new platform decking at station S-49 (Beldons Landing).

Other monitoring station maintenance-related efforts in the marsh included

- removal of inactive pond stage recording equipment and soil moisture sampling probes from the marsh; and
- removal of discontinued special stations S-20 (Hollywood), A-52 (Morrow Drain), A-60 (Mallard), and A-68 (Grizzly King Intake).

Vegetation Monitoring

Under SMPA, the Department and USBR are required to conduct a vegetation survey of the marsh every 3 years. In April 1999, a new vegetation methodology, developed by DFG, was recommended by

Figure 4-2
Compliance and Monitoring Stations in the Suisun Bay and Marsh

the SMPA Environmental Coordination Advisory Team and approved by SMPA coordinators. The accepted survey methodology, *The Vegetation Survey for the Suisun Marsh, A New Methodology*, includes documenting annual changes in preferred habitat for the salt marsh harvest mouse, and gathering vegetation data.

Aerial photos of the marsh were taken in June 1999. In July 1999, DFG began photo interpretation and GIS scanning and registration. Between August and October 1999, DFG conducted vegetation sampling at randomly selected vegetation plots throughout the marsh. A final report and vegetation map will be available by November 2000.

Salt Marsh Harvest Mouse Monitoring in Conservation Areas

To meet the permit requirements of the U.S. Fish and Wildlife Service Biological Opinion for the Suisun Marsh Plan of Protection, eight areas, totaling about 1,300 acres, have been set aside as salt marsh harvest mouse monitoring conservation areas. Approximately 400 acres of wetland, including 100 acres of salt marsh harvest mouse habitat, were constructed at Island Slough on Grizzly Island. In 1998, ECAT was formed to assure future compliance with permit and monitoring requirements. The regulatory agencies, the Corps and USFWS, regularly participated at the monthly ECAT meetings. In 1999, to meet the goal of 2,500 acres of salt marsh harvest mouse habitat, DFG proposed the addition of six new salt marsh harvest mouse conservation areas totaling approximately 1,400 acres. USFWS approval of the six new conservation areas is pending.

Regular monitoring of the salt marsh harvest mouse conservation areas began in 1998, when the eight original conservation areas were surveyed. During 1999, the following areas were surveyed: five of the original conservation areas; six proposed conservation areas; and the salt marsh harvest mouse habitat at Island Slough. Salt marsh harvest mice were found at all surveyed areas, often in very high numbers.

Suisun Marsh Waterfowl Feeding Ecology Study

The objective of the waterfowl feeding ecology study was to determine the food source for mallards, north-

ern pintail, and green winged teal in Suisun Marsh. During winters 1997 and 1998, 223 feeding birds were collected and their esophagi removed for analysis. Mud core samples were also collected from feeding sites to assess availability of plant and invertebrate foods. In addition, hunters from public and private areas of the marsh contributed over 750 esophagi for the study.

The samples are being analyzed at U.C. Davis laboratory. More than 500 esophagi have been sorted, dried, weighed, and analyzed. A final report including all samples is expected by spring 2001.

Aquatic Monitoring

During 1998, the Department contracted with University of California at Davis and DFG to conduct fisheries monitoring in Suisun Marsh. The monitoring was conducted to meet the Corps and San Francisco Bay Conservation and Development Commission permit requirements for construction and operation of the gates and the NMFS 1993 Biological Opinion for Operation of the SWP and CVP.

The U.C. Davis fish sampling and DFG juvenile striped bass sampling have not led to definitive findings on the gates' impacts, since the control or background condition for an assessment (the absence of gates) no longer exists. The data analyses addressed the question indirectly by comparing data collected before and after 1988. Because the overall decline in Suisun Marsh fish abundance began before installation of the gates, the decline seems independent of gate operation.

U.C. Davis has sampled for fish in Suisun Marsh since 1979, with Department and USBR funding. During 1999, sampling continued as in previous years, with larval sampling ending about 5 weeks early due to Delta smelt take restrictions. Results from 1999 sampling indicate that population levels continue to fluctuate at lower levels compared to the early 1980s. Since 1988, introduced species have dominated the fisheries. In 1999, Delta smelt and longfin smelt numbers were the highest since 1984 and 1982, respectively. The presence of eggs and larvae of Delta smelt and longfin smelt indicates that these species used the marsh for rearing and possibly

spawning in 1994 through 1999. Splittail larva were only captured in 1995, 1996, and 1998.

Since the late 1970s, DFG has monitored *Neomysis mercedis* densities and chlorophyll *a* concentration, an indicator of phytoplankton abundance, in the marsh. In 1998, *N. mercedis* samples were collected each month, although chlorophyll *a* samples were not collected until May of that year. *N. mercedis* has declined in Suisun Marsh since the 1970s, with the most dramatic decreases evident after 1991. Densities of *N. mercedis* were low throughout 1998. Food limitation, caused by reduced phytoplankton abundance, is the most probable cause for the decline. Overall, chlorophyll *a* concentration has decreased in Suisun Marsh since 1987. The decline has been attributed to the presence of *Potamocorbula amurensis* and to decreases in freshwater flows during drought years. Chlorophyll *a* concentrations increased somewhat in 1998 compared to levels measured in 1996 and 1997. Construction and operation of the control gates does not appear to have caused a decrease in chlorophyll *a* levels. Results from 1999 sampling will be available in late 2000.

DFG researchers also conduct sampling for juvenile striped bass (defined as schools of fish with mean length from 17.8 mm to 38.1 mm) in Suisun Marsh. In 1998, abundance in Montezuma Slough was the second lowest measured to date. Since sampling began in 1959 a gradual decrease in the average abundance has been observed in the Delta and Montezuma Slough. Because the decrease has been relatively constant over the last 30 years, it is unlikely that changes in abundance were due to installation and operation of the control gates.

Mitigation and Fulfillment of Permit Conditions

Suisun Marsh Salinity Control Gates Flashboard Modification Study

The flashboard modification study continued for the second year in fall 1999. The study is evaluating the effectiveness of the two 3-feet-by-68-feet horizontal slots in providing passage for adult salmon and determined the effect of the slots on salinities in the marsh.

From September 1 through November 9, 1999, the gates' operation was tailored to the adult salmon passage study conducted jointly by the Department, USBR, DFG, SRCD, and NMFS. The operations were timed to coincide with the release of tagged adult salmon during three different phases:

- September 1 through 26, 1999, Phase I: gates operating tidally and modified flashboards installed
- September 27 through October 14, 1999, Phase II: gates operating tidally and original flashboards installed
- October 15 through November 9, 1999, Phase III: all three gates held open and flashboards removed from the main channel

Results from the 1998 and 1999 study periods are still being analyzed by the control gates steering group. Preliminary results indicate that the slots are not improving adult salmon passage and may, in fact, be hindering it. A report discussing the analyses of 1993, 1994, 1998, and 1999 data and any recommendations for future studies is expected in February 2001.

Morrow Island Distribution System

The Department has fulfilled the following permit conditions required for the Morrow Island Distribution System:

- trapping and relocation of salt marsh harvest mice from the project's impact zones to DFG land
- purchase, development, management, and monitoring of 57 acres of salt marsh harvest mouse habitat (seasonal wetlands)
- the restoration of the impact zones in seasonal wetlands and the distribution ditches
- replacement of habitat associated with the live eucalyptus trees removed from the north levee of the system during the ditch dredging

Trapping and relocation of salt marsh harvest mice was completed in 1997, the first project year. Fifty-seven acres of mitigation land were delineated from previously purchased lands at Island Slough near Grizzly Island in 1997-98. A management and monitoring plan for the mitigation area has been

developed and restoration was initiated in 1999. The south levee waterside slopes were seeded with natives in 1998, and although the slopes have revegetated, little of the native seed has thrived. The spoil areas (impacted seasonal wetlands) are returning to their pre-project condition; pickleweed and other associated brackish-water plants are established, but the desired ground cover has not yet been obtained.

Salt Marsh Harvest Mouse Habitat Restoration

On April 13, 1999, the Suisun Marsh ECAT team agreed that the 57-acre mitigation site for MIDS would be placed on DFG's Island Slough unit of the Grizzly Island wildlife area. The mitigation development, management, and monitoring plan for 57 acres at Island Slough has been developed and is being implemented.

The construction (water control structures and levee coring) of the project began in spring 1999. The property improvements, which are expected to be completed in spring 2000, will allow water management for the salt marsh harvest mouse to function independently from the waterfowl management areas.

The completion date for this mitigation site is estimated for summer 2004.

Morrow Island Distribution System Fish Screen and Alternatives

On July 2, 1997, the Corps issued permit No. 20698N to perform maintenance on MIDS. Permit conditions required installation of a fish screen on the Goodyear Slough diversion structure. In early 1999, the Department began development of design alternatives for the fish screen. Design alternatives were presented and discussed at SMPA-ECAT meetings. In consultation with USFWS and the Corps, the Department and USBR developed a hybrid proposal for meeting the permit condition. The proposal consists of the following:

- installation of two 12-foot conical screens and one 48-inch drain at the MIDS intake facility

- installation of five 12-foot conical screens distributed along Goodyear and Suisun Sloughs
- addition of one 36-inch turnout along C-line
- addition of one 36-inch combination turnout and one drain along M-line
- new operations agreement for MIDS

Reports

In 1999, the following reports on Suisun Marsh were written or published.

- *The Annual Data Summary Reports* for water year 1996-97 were published in December 1999. The reports include data from water quality monitoring stations, salt marsh harvest mouse surveys, waterfowl surveys conducted in the marsh, and a discussion of maintenance activities in the marsh.
- Starting in water year 1996-97, the report was revised by placing the background information in a separate document, *Suisun Marsh Monitoring Program Reference Guide*. The *Reference Guide* provides comprehensive information on the Department's Suisun Marsh monitoring program. The *Annual Data Summary Report* and *Reference Guide* are available online at iep.water.ca.gov/suisun/curr-report/, or by request.

The Suisun Marsh Salinity Control Gates Fisheries Monitoring Annual Reports. Reports covering water years 1995-96 and 1996-97 were completed in August and November 1999, respectively. In lieu of a 1998 report, data from water year 1997-98 were incorporated into the aquatic resources chapter of *The Comprehensive Review of Suisun Marsh Monitoring Data*, expected to be released in late 2000.

- *SEW Final Report*. The *SEW Final Report* includes recommendations for water quality objectives to improve conditions for beneficial uses in Suisun Marsh. Additionally, the work-group prepared a set of recommendations for future research and monitoring in the marsh.

The final report presents each subcommittee's set of recommendations. Ultimately SEW chose not to develop a single workgroup recommendation, due to the divergent views of the various subcommittees. The report contains recommendations for comprehensive monitoring and research needs for Suisun Marsh, which were also submitted to the CALFED Comprehensive Monitoring Assessment and Research Program.

The final report was reviewed by IEP; no comments were received. It is expected to be reviewed by SWRCB in January 2001.

- Biological Assessment for Amendment Three to SMPA. SMPA parties—the Department, USBR, DFG, and SRCD—prepared and forwarded a biological assessment for SMPA as modified by Amendment Three to USFWS in October 1999. This action completed the requirements for Section 7 consultation under FESA. Additional documentation was prepared by SRCD and DFG and forwarded to USFWS. USFWS was scheduled to complete consultation and issue a draft biological opinion in February 2000.

Suisun Marsh Expenditure History

Suisun Marsh expenditures and reimbursements administered by the Department for calendar years 1968 through December 1999 are summarized in Table 4-2. From 1968 through December 31, 1999, the Department disbursed more than \$94.5 million of SWP funds for planning, design, environmental documentation, construction, maintenance, monitoring, mitigation, and permit compliance in support of implementing the plan of protection for Suisun Marsh and SMPA and meeting standards set by SWRCB. USBR has reimbursed the Department about \$35.5 million—37.6 percent—and the State's general fund has reimbursed about \$9.5 million—10 percent. These figures do not include up-front payments made by USBR for staff and other direct costs, as well as about \$5.7 million in USBR interest payments during 1988 and 1989.

Annual figures are reported in Table 4-2 for the Department's up-front payments, USBR reimbursements, general fund reimbursements, and the Department's cumulative expenditure balance.

Table 4-2
Suisun Marsh Expenditures and Reimbursements
Administered by the Department

1997	3,631,829	1,520,219	0	39,172,188
1998	5,342,834	1,107,501	0	43,407,521
1999	8,792,037	2,696,200	0	49,503,358
Total	94,519,441 ^e	35,538,083 ^{e, f, g}	\$9,478,000 ^h	49,503,358 ^g

^a CXB = (previous year's CXB + departmental upfront payment) - (USBR + general fund reimbursements)

^b USBR paid an additional \$5,111,831 as interest in 1988 not shown in the table.

^c USBR paid an additional \$607,175 as interest in 1989 not shown in the table.

^d Under State Assembly Bill 1442, the general fund paid 20 percent of departmental up-front payment through June 1988, amounting to \$9,478,000. This payment includes \$6,643,600 for the Department's recreation project purpose share of 14 percent.

^e Does not include USBR up-front payments for staff and other direct costs.

^f USBR has paid 37.6 percent of the total Department up-front payment.

^g The Department has paid 52.4 percent of the total Department up-front payment.

^h General fund has paid 10 percent of the total Department up-front payment.

Information in this chapter was contributed by the Environmental Services Office, the Division of Operations and Maintenance, and the Division of Planning and Local Assistance.

Chapter 5

Local Assistance Programs

Adjusting the flow at an irrigation canal gate

Significant Events

- The San Joaquin Valley Drainage Implementation Program completed eight technical committee reports and three subarea reports evaluating status of drainage problems and identifying technical solution options.
- The Department's California Irrigation Management Information System was expanded to 106 weather stations in 1999 and current data is being put on an Internet site.

Through the Division of Planning and Local Assistance, the Department of Water Resources manages Water Use Efficiency, the Davis-Grunsky Act, Agricultural Drainage, Environmental Impact Document Review, and Water Conservation Bond Law programs and participates in several other programs that assist local agencies and benefit State Water Project contractors.

Davis-Grunsky Act Program

The Davis-Grunsky Act, authorized in 1960 as part of the Burns-Porter Act, provides construction loans for local domestic water projects and agricultural water conservation projects. It provides grants for recreation and fish and wildlife enhancement. Loans and grants may also be given to rehabilitate dams and reservoirs.

The Department's ongoing administration of the program provides oversight of the 32 recreation grant projects to ensure compliance with the contracts. Administration costs are recovered from the revenues provided by the repayment of Davis-Grunsky loans. The recreation grant contracts are being amended to reflect actual facilities constructed and the modification of the Department's fee oversight function.

In this reporting period, the Davis-Grunsky Act Program funded one activity, described below.

Big Bear Municipal Water District

Phase II repairs of Bear Valley Dam, San Bernardino County, continued to await the Department of Transportation's actions to construct the required replacement road downstream of the dam. The \$380,000 of Davis-Grunsky grant contract funds approved for Phase II construction remained available to the district. The district is progressing toward Phase II construction through a Request for Proposal for service to the spillway gates.

Water Use Efficiency

The Department's California Irrigation Management Information System was expanded to 106 weather stations in 1999 and current data is being put on an Internet site. The Department provides reference evapotranspiration information to several local agencies. There are more than 5,000 requests for information from the CIMIS database and Internet site each month.

The Department supported the development of a training program to certify urban water conservation specialists. The American Water Works Association's California-Nevada Section presented the first Water Conservation Practitioner classes and tests at Conserv '99 in January 1999. A growing number of agencies are requiring the certification as a prerequisite for hiring in the water conservation staff category.

The *Water Conservation News* continued to be the primary water conservation outreach newsletter. The quarterly publication reaches more than 8,000 California subscribers.

Agricultural Drainage Program

San Joaquin Valley Drainage Implementation Program

The Department continues to participate in the multi-agency San Joaquin Valley Drainage Implementation Program. Four State and four federal agencies sponsor SJVDIP, with the Department as the lead agency. The Department provides management and staff and

contributes funding. During December 1996, the program's management group approved in concept a Proposed Action Plan, which was advanced by an association of local districts, the University of California, and the Department of Food and Agriculture. The intent of the Proposed Action Plan is to update the 1990 Management Plan and pursue voluntary implementation of the recommended options. The Action Plan has three stages as described below.

The first stage consisted of two concurrent, coordinated independent tasks. First, subarea committees assessed the feasibility of adopting the management recommendations proposed in the management plan and prepared reports on San Joaquin Valley drainage problem areas. Second, a set of technical committees evaluated the technical and economic management options.

During the second stage, an Ad Hoc Coordination Committee synthesized the information from the first stage into a report and, based on technical and economic considerations, identified interactions and trade-offs among management options and developed a set of recommendations. The technical committee and subarea reports were completed in 1999. The Ad Hoc Coordination Committee plans to prepare a final report to SJVDIP by January 2000.

The third stage will use the recommendations formulated during the second stage and identify acceptable mechanisms to encourage the adoption and voluntary implementation of the updated management plan. Shallow water tables, toxic trace elements, and high salinity threaten agricultural productivity and environmental quality. The Department has a responsibility to engage in activities to ameliorate the problems associated with irrigated agriculture. Salinity buildup on the west side and the lower parts of the Sacramento Valley is gradually destroying agricultural lands.

The SJVDIP Action Plan and the cooperative effort initiated among the parties are necessary to resolve drainage problems. The Department will continue to participate in this effort to assist the local districts, working with other agencies, and continues to play a major role in collecting necessary data, developing and transferring technologies, identifying research

needs, and helping districts and growers implement the drainage management options. Information on SJVDIP and its reports can be found on the Department's DPLA Internet site (www.dpla.water.ca.gov).

Proposition 204

Proposition 204, *The Safe, Clean, Reliable Water Supply Act*, authorized the transfer of approximately \$6 million from State Water Resources Control Board to DFA for developing methods of agricultural drainage water reuse. DFA has asked the Department to conduct the necessary studies. The Department expects to complete the interagency contract and begin the work as soon as funding is made available. This program is closely coordinated with SJVDIP.

Drainage Monitoring and Evaluation

The Department continues to

- participate in a cooperative information system program with the U.S. Bureau of Reclamation and the Central Valley Regional Water Quality Control Board. This program provides local, State, and federal agencies with flow and salinity projections to assist in managing drainage releases into the San Joaquin River. It operates under a 2-year grant from CALFED, which expires in 2001.
- monitor shallow groundwater levels and electrical conductivity data as well as collect drainage-water flow data and water quality data from about 30 tile drainage system sumps. Using this data in conjunction with land use data and irrigation methods data, the Department produced land use maps of the shallow groundwater areas and irrigation methods maps, in addition to the annual drainage report.

Drainage Treatment

The Department continues to investigate technologies to treat agricultural drainage water and agreed to participate in a pilot-scale desalting project at Buena Vista Water Storage District in Kern County. The project is a cooperative effort among Buena Vista Water Storage District, Boyle Engineering, University of California at Los Angeles, and the Department to develop information on pretreatment, reverse osmosis treatment, and brine disposal. Agreements

were written and plant operation is planned for the 2000 and 2001 irrigation seasons.

Other activities included support of a cooperative investigation into the use of wetlands for selenium removal at Tulare Lake Drainage District and investigations of processes for concentrating and purifying drainage salt for marketing purposes. The Department also provided support for an investigation at UCLA to develop systematic protocol to evaluate and rank potential nanofiltration and reverse osmosis membranes in the treatment of subsurface drainage water.

Lastly, draft summary operation reports and appendices were completed for the investigation at the multi-agency Adams Avenue Agricultural Drainage Research Center. The investigation involved selenium reduction/removal from drainage water using anaerobic sludge blanket reactors, fluidized bed reactors, a packed-bed reactor, and slow sand filters.

On-Farm Drainage Reduction and Reuse Program

The Department's on-Farm Drainage Reduction and Reuse Program provides technical assistance, information, and other resources to all growers and irrigators. The program helps irrigation districts and growers apply irrigation water efficiently to reduce deep percolation and drainage water from the immediate on-farm source, while providing a sustainable soil environment by maintaining salt balance in the crop root zone.

The program objective is being achieved through on-farm demonstration projects, studies, research, and educational training and workshops. Workshop topics include irrigation scheduling and management, including upgrading, maintenance, operations, and performance, advances in irrigation technology, irrigation system evaluation, drainage reuse, and salinity management. These activities help improve and advance irrigation management, fine tune the performance of irrigation hardware, and increase growers' and irrigators' knowledge.

Staff is presently involved in two major activities:

- management of six in-progress contracts

- work on SJVDIP Activity Plan and Ad Hoc Coordination Committee

Management of Six In-Progress Contracts. In-progress contracts for research and demonstration projects, and contracts for workshops, are designed to disseminate state-of-the-art irrigation technologies and management practices to reduce and manage drainage water. The following contracts were developed from a Request for Proposals process initiated in 1996-97, which was targeted for State water contracts areas. The contracts in place or under development in 1999 include

- *Integrated Management of Irrigation and Shallow Groundwater*—field demonstration at Westlake Farms of irrigation management techniques to optimize crop use of shallow groundwater.
- *Lost Hills Drainage Reuse Trial*—a small trial to determine if drainage water can be reused on selected crops, such as pistachios, and incorporated into the District's drainage water management programs.
- *Lost Hills Pre-irrigation Drainage Reduction*—field demonstration of sprinkler/furrow irrigation management for pre-irrigation drainage reduction.
- *Pond-Shafter-Wasco Mobile Lab*—program to assist growers with irrigation system evaluations to improve distribution uniformity and irrigation efficiency.
- *Pond-Shafter-Wasco Irrigation Training Workshops*—irrigation training workshops conducted in both English and Spanish for growers and field workers.
- *Center for Irrigation Technology Irrigation/Drainage Management Workshops*—training and educational workshops conducted on recent advances in irrigation and drainage management, conducted at California State University, Fresno.

Work on SJVDIP Activity Plan and Technical Committees. Staff helped the SJVDIP coordinator execute the Activity Plan update of the 1990 SJVDIP Drainage Management Plan. Staff have participated in eight technical committees and contributed to the writing of the committees' reports. Final technical and subarea reports were completed in 1999 and work is continuing by the Ad Hoc Coordination

Committee to prepare a final report to SJVDIP by January 2000.

Evaporation Ponds

Operators of the agricultural evaporation ponds continue to function under the waste-discharge requirements adopted by the Central Valley Regional Water Quality Control Board in August 1994. Clean wetlands mitigation procedures provide compensation for operation of the evaporation ponds. Pond management for some systems has changed and most required structural modifications have been completed at the evaporation basins. Research funded through the Department's Evaporation Pond Investigation developed most of these mitigation procedures. As required, the pond operators compiled draft progress reports for the first years of implementation. CVRWQCB has reviewed these reports for adequacy and will prepare modifications to the waste-discharge requirements if needed.

During 1999, the Department continued to

- assist CVRWQCB in assessing the biological implications of any proposed modifications.
- fund and coordinate research on the evaporation ponds. A study by the Biological Resource Division to analyze shorebird-feeding behavior was completed and a final report was issued.
- study the Rainbow Ranch evaporation basin in Kern County. Based on studies that the Department and U.S. Fish and Wildlife Service conducted in the past, a relationship between waterborne selenium and selenium concentrations found in eggs was described for the evaporation basins. For the last few years, the selenium levels in shore bird eggs at Rainbow Ranch were lower than expected. Initial studies determined that, at times, the evaporation pond cells develop both thermal and salinity stratification. This stratification may be associated with the low levels of egg selenium. The relationship between egg selenium levels and the conditions that result in stratification has not yet been determined.

Other Activities

Department staff participated in a salt utilization committee and prepared a pamphlet on potential uses of drainage-generated salts. The Department contin-

ues experimental work at Red Rock Ranch, an Integrated on-Farm Drainage Management project. In 1999, a report called *Integrated Systems for Agricultural Drainage Management on Irrigated Farmland* was prepared and released to the public. The report presented the results of 4 years of research at the Red Rock Ranch.

The Department participated in three IFDM workshops, which were held at three locations within the San Joaquin Valley. The workshops were jointly organized by the Department and the Center for Irrigation Technology and included the preparation of an IFDM textbook for the workshops. Other activities included development of a proposal for CALFED funding for the utilization of farm-based salt and designing an IFDM system for the Rainbow Ranch to convert it from an evaporation basin to an IFDM operation.

Environmental Impact Documents Review

The Environmental Review section in DPLA screens State Clearinghouse documents and circulates SWP-related materials for review by the Department's four districts, as well as DPLA, the Department of Operations and Maintenance, and the Division of Engineering. In addition, other divisions and offices are notified of activities and are asked to comment when their expertise is required.

Some environmental impact documents handled by the State Clearinghouse concern proposed activities that would affect the SWP. State Clearinghouse documents are regularly reviewed to identify any public safety or liability issues arising from the proposed activities.

From January through December 1999, about 3,300 documents were screened by the Environmental Review section, with 398 referred for detailed review. O&M received 85 of these referrals. The State Water Project Analysis Office received 21 referrals, and the Office of State Water Project Planning received 3. In addition to formal referrals, 179 informal referrals were made to departmental staff, which were referred to staff for information rather than comment; however, some of them were for-

mally referred to other departmental staff for comment.

Of the documents submitted for formal review, about 12 percent generated written comments that were submitted to the lead agency. They included safety and water supply issues, encroachment on physical facilities, and water quality issues. Additional departmental actions involving such items as encroachment permit submittals and informal comments took place, but cannot be tracked by the Environmental Review Section.

Since 1995, weekly summary reports on documents received from the State Clearinghouse have been made available by e-mail, increasing the report's availability and speed of distribution. About 80 requests from departmental staff during 1999 were related to the distribution of these reports. In addition, Environmental Review Section staff filled eight requests from two SWP contractors.

During 1999, the Environmental Review Section also tracked documents related to development along the California Aqueduct, water transfers and other supply issues, wastewater treatment, and fiber optic construction near SWP facilities.

Water Conservation Bond Laws

With the objective of assisting local agencies in obtaining financing for their water management programs, California voters approved four bond laws between 1984 and 1996 authorizing the Department to provide low interest loans and grants to fund project feasibility studies or construction activities.

- The Clean Water Bond Law of 1984 (Proposition 25) authorized \$10.5 million for water conservation projects.
- The Water Conservation and Water Quality Bond Law of 1986 (Proposition 44) authorized \$75 million for water conservation and groundwater recharge projects.

- The Water Conservation Bond Law of 1988 (Proposition 82) authorized \$60 million for water conservation, groundwater recharge, and new local water supply improvements.
- The Safe, Clean, Reliable, Water Supply Act of 1996 (Proposition 204) authorized \$55 million for water conservation, groundwater recharge, and local water supply projects and authorized about \$6 million for DFA for drainage reuse studies and programs. Since then, DFA requested the Department to administer the \$6 million and conduct the necessary projects.

Construction loans are available for up to \$5 million per project, with repayment up to 20 years at reduced interest rates for most programs. Proposition 204 provided grants for local water supply feasibility studies and a single construction grant for a groundwater recharge project. Among other approval criteria, applicants for this funding must demonstrate that project benefits exceed project costs. Typical projects fall under the following three categories:

Water Conservation

- improvements to, or replacement of, distribution and storage systems
- lining and piping ditches
- water meters
- water recycling distribution systems

Groundwater Recharge

- facilities for new artificial groundwater recharge
- expansion of existing artificial groundwater recharge facilities

Local Water Supply/Local Projects

- new conveyance and/or storage facilities
- groundwater recharge extraction facilities, well-field development
- desalination (ocean or brackish groundwater recovery)

Table 5-1, organized by project type, summarizes the number of projects and funds committed for each of the four bond laws.

Table 5-1
Water Conservation Bond Laws Projects and Funding, 1984-99
 (Millions of Dollars)

<i>Bond Law</i>	<i>Type of Project</i>	<i>Number of Projects^a</i>	<i>Funding^a</i>
Clean Water Bond Law of 1984	Water Conservation	7	9.74
Water Conservation/Water Quality Bond Law of 1986	Water Conservation	23	38.62
	Groundwater Recharge	10	28.04
	Subtotal	33	66.66
Water Conservation Bond Law of 1988	Water Conservation	7	17.44
	Groundwater Recharge	8	24.30
	Local Water Supply	4	9.00
	Subtotal	19	50.74
Safe, Clean, Reliable Water Supply Act of 1996	Water Conservation	0	0.00
	Groundwater Recharge	4	20.00
	Local Water Supply	1	0.15
	Subtotal	5	20.15
<i>Subtotals</i>	All Water Conservation	37	65.80
	All Groundwater Recharge	22	72.34
	All Local Water Supply	5	9.15
Total	All Projects	64	147.29

^a Construction project and feasibility study loan and grant commitments as of 12/31/99.

Chapter 6

Legislation and Litigation

Close-up of the west entrance to
the Capitol

Significant Events

- **AB 1584 (Machado) Safe Drinking Water, Clean Water, Watershed Protection, and Flood Protection Act (Chapter 725, Statutes of 1999).** The Legislature passed AB 1584, a bond measure which was signed by the Governor and will be placed on the March 7, 2000, ballot as Proposition 13. If adopted, Proposition 13 will provide \$1.97 billion in bonds to be used in the

following manner: (1) Safe Drinking Water Program: \$70 million; (2) Flood Protection: \$292 million; (3) Watershed Protection Program: \$468 million; (4) Clean Water and Water Recycling Account: \$355 million; (5) Water Conservation Programs: \$155 million; and (6) Water Supply, Reliability and Infrastructure Programs: \$630 million.

The Department of Water Resources' Deputy Director for Legislation monitors State and federal legislation introduced or enacted, including bills or laws that could impact the State Water Project. Similarly, the Office of the Chief Counsel tracks litigation of potential significance to the SWP and manages litigation involving SWP operations.

Legislation

State Legislation

AB 1584 (Machado) Safe Drinking Water, Clean Water, Watershed Protection, and Flood Protection Act (Chapter 725, Statutes of 1999). The Legislature passed AB 1584, a bond measure which was signed by the Governor and will be placed on the March 7, 2000, ballot as Proposition 13. If adopted, Proposition 13 will provide \$1.97 billion in bonds to be used in the following manner: (1) Safe Drinking Water Program: \$70 million; (2) Flood Protection: \$292 million; (3) Watershed Protection Program: \$468 million; (4) Clean Water and Water Recycling Account: \$355 million; (5) Water Conservation Programs: \$155 million; and (6) Water Supply, Reliability and Infrastructure Programs: \$630 million.

AB 1593 (Villaragiosa) Wild and Scenic Rivers: South Yuba River (Chapter 1017, Statutes of 1999). AB 1593 designates the South Yuba River as "wild and scenic" to be effective January 1, 2001. This is the companion bill to SB 496.

SB 496 (Sher) Wild and Scenic Rivers: South Yuba River (Chapter 1016, Statutes of 1999). SB 496 adds the South Yuba River to the State's wild and scenic rivers system. AB 1593 is the companion bill, which delays designation of the South Yuba River for 1 year.

SB 970 (Costa) Water Rights (Chapter 938, Statutes of 1999). SB 970 enacts the Water Rights Protection and Expedited Short-term Water Transfer Act

of 1999 to streamline the administrative process for approval or denial of water transfers by the State Water Resources Control Board; requires general public notice of water transfers.

SB 1062 (Poochigian) *The California Water Plan* (Chapter 210, Statutes of 1999). SB 1062 codifies the Department's current practice of establishing an advisory committee to update Bulletin 160 (*The California Water Plan*) and requires the Bulletin 160 process to include discussions of potential advantages and disadvantages of various water supply strategies.

SB 1107 (Sher) Operator Certification: Water Distribution Systems (Chapter 755, Statutes of 1999). SB 1107 requires the Department of Health Services to set forth a program that examines and certifies supervisors and operators of water distribution systems, including the Department's small water treatment plants.

Federal Legislation

S 507 (J. Warner) Water Resources Development Act of 1999, Public Law 106-53. S 507 authorizes future federal appropriations for a variety of water resource projects, including several flood control and watershed projects in California.

HR 4060 (McDade) Energy and Water Development Appropriations, 1999 Public Law 105-245. HR 4060 appropriates monies for energy and water development purposes, including CALFED activities at \$75 million.

Litigation

As of December 31, 1999, the Department was involved in a number of court cases related to management of the SWP. In addition, the Department monitored other cases that could significantly impact management of the SWP.

San Luis and Delta-Mendota Water Authority v. United States, et al. On November 12, 1997, the San Luis and Delta-Mendota Water Authority filed a lawsuit in federal district court for injunctive relief against the United States for misinterpretation and misapplication of the Central Valley Project Improvement Act. The plaintiffs have challenged the legality of the U.S. Department of the Interior's November 20, 1997, *CVPIA Final Administrative Proposal on Management of Section 3406(b)(2) Water*, in which DOI sets forth its plan for implementing the so-called "(b)(2)" section of CVPIA. The water districts claim that the administrative proposal fails to account for the water as required by CVPIA and is subject to the National Environmental Policy Act. In contrast, environmental groups also filed a lawsuit against the U.S., claiming that the proposal fails to properly account for the water, fails to dedicate sufficient water to implement (b)(2), and that the U.S. misinterpreted its authority in permitting reuse of CVP yield. The two cases have been consolidated and, in November 1998, plaintiffs submitted motions for partial summary judgement in preparation for a January 1999 hearing.

On March 19, 1999, the federal district court issued a Memorandum Opinion for partial summary judgement finding that the administrative proposal was contrary to CVPIA. Plaintiffs sought a preliminary injunction to prevent the U.S. Bureau of Reclamation from implementing (b)(2) measures. In December 1999, the federal district court issued an order regarding the preliminary injunction request, concluding that additional evidence was necessary to determine if DOI had complied with CVPIA. The court appointed an expert witness to present testimony in early 2000, after which it is expected to issue an order on the preliminary injunction request.

Planning and Conservation League, Plumas County, and Santa Barbara Citizens Planning

Association of Santa Barbara County v. Department of Water Resources and Central Coast Water Authority. The Planning and Conservation League filed a lawsuit on December 27, 1995, against the Department and Central Coast Water Authority, challenging the California Environmental Quality Act compliance for the Monterey Amendment. PCL amended the complaint February 13, 1996, alleging that the Department could not legally transfer the Kern Water Bank to Kern County Water Agency as part of the Monterey Amendment.

After a hearing held May 17, 1996, a Sacramento County Superior Court judge ruled in favor of the Department and CCWA on PCL's complaint and dismissed the lawsuit. With regard to the CEQA causes of action, the court ruled that the Department should have served as lead agency, but that this was a harmless error, not requiring the preparation of a new environmental impact report. The court also ruled that PCL had failed to join indispensable parties in the lawsuit, including Metropolitan Water District of Southern California and KCWA, in its cause of action to enjoin the transfer of KWB. On August 15, 1996, judgement was entered in favor of the Department and CCWA.

PCL appealed the decision to the Third District Court of Appeal. The appeal addresses whether the Superior Court correctly ruled that the SWP contractors are indispensable parties and whether CEQA was complied with. Briefing is complete and the parties await the Court of Appeal's decision.

Southern California Bass Council, et al. v. State of California. In late November 1994, the Southern California Bass Council, the Sierra Club, and the Audubon Society filed a CEQA lawsuit against the Department, challenging the Department's Mitigated Negative Declaration prepared for the reconstruction of the intake tower at Silverwood Lake. The Department was directed by the Federal Energy Regulatory Commission to replace the existing intake tower to the San Bernardino Tunnel because the existing tower did not meet current seismic standards. The petitioners claimed the Department's environmental documentation did not provide sufficient mitigation for adverse effects on the environment, including impacts on fisheries and the bald eagle.

At an April 1995 hearing in San Bernardino Superior Court, Judge John Kennedy, Jr., ruled that the Department's mitigated negative declaration was adequate. The ruling validated the Department's plans to mitigate possible adverse effects on fish and wildlife resources, including the bald eagle, and recreation at the lake.

In June 1995, the petitioners appealed the trial court judgement. No order for stay (to prevent work from proceeding) was filed, and construction at Silverwood Lake began in September 1995. Work on replacement of the intake tower was substantially completed by May 1997, and the lake was returned to its preproject level.

On October 17, 1996, the Court of Appeal affirmed the Mitigated Negative Declaration in all respects but one. As to fishery mitigation, the appellate court held that the Mitigated Negative Declaration should have included either a commitment to the specific nature and extent of restocking the fishery or specific standards under which the Department and the California Department of Fish and Game would determine the nature and extent of restocking.

Petitioners then filed a petition for review with the California Supreme Court seeking to invalidate the

entire Mitigated Negative Declaration. On January 22, 1997, the California Supreme Court denied the petition for review, and jurisdiction was returned to the Superior Court. A hearing was held in San Bernardino Superior Court on May 2, 1997, and the Department presented its Fishery Mitigation Plan. Further briefing occurred on the merits of the plan, and oral argument was postponed to January 30, 1998.

On January 30, 1998, upon remand from the Court of Appeal, Judge Kennedy approved the Department's fishery mitigation plan as providing sufficient performance criteria for mitigating the project's significant effects on the fishery at Silverwood Lake. The original mitigation plan included three primary mitigation measures: (1) fish macro and micro habitat enhancement; (2) fish population studies through 2001; and (3) a one-time fish stocking if the fishery has not recovered by the end of 2001. In January 1999, the Department filed a mitigation status report, which was approved by the court. The Department implemented the mitigation plan during 1999.

Information for this chapter was contributed by the Deputy Director for Legislation and the Office of the Chief Counsel.

Chapter 7

Storage and Delivery Capabilities and Water Supply Development

Overview of Pyramid Lake downstream
of the dam, with Interstate 5
in the background

Significant Events

- CALFED released its Draft Programmatic Environmental Impact Statement/Environmental Impact Report for the Bay-Delta Program.
- Investigations and feasibility studies were started for the CALFED Integrated Storage Investigations Program.
- The State Water Resources Control Board completed Phases 1 through 7 of the Bay-Delta Hearings and issued Water Right Decision 1641 in the matters of: *Implementation of the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary; A Petition to Change Points of Diversion of the Central Valley Project and State Water Project in the Southern Delta; and A Petition to Change Places of Use and Purposes of Use of the Central Valley Project.*
- Department staff assisted SWRCB in the publication of *A Guide to Water Transfers* (July 1999 draft).

To deliver the full annual water entitlements specified in water service contracts, the Department of Water Resources will need to construct additional storage and delivery facilities as part of the State Water Project, as well as maintain and improve the reliability of all SWP supplies. However, finding environmentally and technically suitable projects and satisfying many complex environmental procedures, laws, and regulations, present two significant challenges in planning and developing new facilities. Many environmental concerns center on the effects that additional storage and delivery facilities may have on the water quality and the environment of the Sacramento-San Joaquin Delta. The Delta is the critical link in the SWP conveyance system. As such, developing additional SWP facilities depends on resolution of Delta conflicts and the solutions currently being outlined by CALFED.

Through 1999, the CALFED Bay-Delta Program continued a comprehensive, long-term solution for the Delta. This program is a component of a process defined in the State-federal Framework Agreement signed in June 1994. This agreement calls for a cooperative and coordinated process to solve long-term water quality and ecosystem problems in the Bay-Delta estuary. The signers of the agreement, known collectively as CALFED, became responsible for setting water quality standards and developing long-term solutions for fish and wildlife, water supply reliability, flood control, and water quality problems in the estuary.

In June 1999, CALFED released its multivolume Draft PEIS/EIR for the Bay-Delta Program. The plan proposes strategies for improvements in four inter-related problem areas: ecosystem health, water quality, levee system integrity, and water supply reliability. It is comprised of near-term actions and studies and sets the groundwork for actions in the future. The release of the Draft PEIS/EIR marked a milestone for the CALFED agencies. Work continues on completion of a Final PEIS/EIR, which will lead to implementation of numerous programs and projects.

The Department has vigorously supported this effort, seeing it as a means of developing and managing the State's water resources to benefit the public and the environment, as well as to meet the water delivery commitments of the SWP. The Department is also developing a planning strategy for the SWP to lay groundwork for the development of additional SWP water supplies. The progress of the planning strategy depends on the evolution of the CALFED Bay-Delta Program and the support of SWP contractors.

Supply Reliability Activities

Increased emphasis has been given to maintaining and improving the reliability of future SWP supplies—the core of SWP planning activities.

Water Supply Contract Evaluation

Evaluation of existing SWP water supply contracts and project operations is a continuing activity aimed at improving reliability.

Transfer and Exchange Evaluations

Evaluation of the effects of proposed non-SWP water transfers on the SWP continues, in cooperation with

the State Water Project Analysis Office, Division of Operations and Maintenance, and the Office of the Chief Counsel. This team develops formal responses to specific issues, projects, or programs. Coordination of this effort by the Office of State Water Project Planning ensures timely identification and evaluation of significant projects. The team identifies and evaluates water transfer proposals, water acquisitions by the U.S. Bureau of Reclamation and other water agencies, and proposes water-right settlement agreements for potential impact on the SWP. Emphasis on early intervention tailors the proposals to minimize adverse effects or maximize benefits to the SWP. The team is monitoring the USBR contract renewal process to evaluate potential impact. These activities help the Department understand the potential cumulative impact of other agencies' actions on the SWP and to proactively address those actions.

The team also explores potential transfer options available to the SWP and individual contractors. Analysis of contractor profiles helps the Department facilitate transfers and exchanges between individual contractors. In addition, the Department coordinates its participation in the CALFED Transfer Agency Group and the Bay-Delta Advisory Committee Transfers Workgroup.

Watershed Management

This continuing effort evaluates the state of the Feather River watershed above Lake Oroville and identifies actions that can be taken within the watershed to increase base-flow runoff and reduce sedimentation. The initial effort explored ways to improve local water supplies without adversely affecting SWP supply or operations. Early activities included installing monitoring equipment and gathering pertinent data on streamflows, water quality, erosion, and land use. This data will be used to formulate reports and studies for future actions. The work continues to receive strong local support.

SWP Bay-Delta Proceedings—1999 Activities

Over the past 30 years, SWRCB has received and reviewed copious amounts of testimony and evidence to establish water quality objectives for the Bay-

Delta estuary to protect urban, agricultural, and fish and wildlife water uses. The current water quality objectives are set forth in the 1995 Bay-Delta Plan, which is designed to implement water quality flow objectives in the Delta, objectives for the Suisun Marsh, salinity control actions in the San Joaquin Basin, objectives for the south Delta including dissolved oxygen, and combined use of the SWP and Central Valley Project points of diversion in the Delta.

The current series of the Bay-Delta Water Right hearings address the implementation of the 1995 Bay-Delta Plan through a water-right hearing process staged in eight phases. The Bay-Delta hearings were held from July 1, 1998, through December 31, 1999. SWRCB heard 80 days of testimony, concluded Phases 1 through 7, and adopted the Final EIRs and Water Right Decision 1641 after considering the following petitions: *Implementation of the Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary*; *A Petition to Change Points of Diversion of the Central Valley Water Project and State Water Project in the Southern Delta*; and *A Petition to Change Places of Use and Purposes of Use of the Central Valley Project*.

Adopted on December 29, 1999, D-1641 addresses objectives to protect water quality and flow in the San Francisco Bay/Sacramento-San Joaquin Delta estuary. Highlights of D-1641 include

- continuation of the interim responsibility of the Department and USBR to meet the water quality objectives for Delta outflow until November 30, 2001, or the adoption of new decision, whichever comes first;
- approval of the joint petition of the Department and USBR to change points of diversion of the CVP and SWP in the south Delta;
- approval of the San Joaquin River Agreement/Vernalis Adaptive Management Plan to provide information on the effects of flow and exports on the San Joaquin fall-run chinook salmon;
- removal from the Department and USBR of the responsibility to meet the objectives at two control stations in the western part of the Suisun Marsh;

- recognition of the contract between the Department and the North Delta Water Agency to assure a dependable water supply of suitable quality; and
- recognition of Cache and Putah Creeks' stipulations that relieves those water right holders from obligation to implement the objectives set out in the 1995 Bay-Delta Plan.

The following is a summary of each phase of the hearings.

In **Phase 1**, SWRCB extended Water Right Order 95-6 after hearing testimony, and renamed it Water Right Order 98-9. This order modifies SWP and CVP rights described in Decision 1485 to make them consistent with the 1995 Bay-Delta Plan.

Phases 2, 2a, and 2b addressed the responsibility of the parties who jointly proposed the San Joaquin River Agreement. They will make available the water required as set out in the agreement. In return, the Department and USBR will compensate them by assuming responsibility for the 1995 WQCP objectives for the San Joaquin River Basin share of Delta outflow.

Phase 3 addressed the Suisun Marsh Preservation Agreement and other alternatives for meeting the Suisun Marsh objectives.

Phase 4 addressed the responsibilities of parties who jointly proposed agreements in the Mokelumne River, Putah Creek, Cache Creek, and north Delta. The Department supported each of these agreements.

Phase 5 addressed responsibilities for meeting agricultural and dissolved oxygen objectives for the San Joaquin River near the City of Stockton. To help meet their obligations, the Department proposed the Interim South Delta Program to improve water circulation and water levels in the south Delta.

Phase 6 dealt with the petition filed by the Department and USBR to authorize joint points of diversion by CVP and the SWP. Under D-1641, SWRCB approved the SWP's Banks Pumping Plant as a point of diversion and rediversion for USBR's water rights.

They also approved CVP's Tracy Pumping Plant as a point of diversion and rediversion for the Department's water rights.

Phase 7 dealt with the petition filed by USBR to change and consolidate places and purposes of water use delineated in certain permits of CVP.

Phase 8 has not yet begun, but will address the responsibility of diverters upstream of the Delta who have not agreed to their role in meeting the 1995 WQCP. Phase 8 is expected to be controversial. Potential solutions discussed in the EIR to allocate this responsibility include the present situation in which only the SWP and CVP are obligated to meet the Delta objectives, and other alternatives that shift some of the obligation to other upstream water rights holders.

Water Supply Development

To meet the SWP contractors' increasing need for water, the Department investigates and implements plans to augment the SWP water supply.

The Department's plans include

- developing programs to transfer water, either through programs such as the drought water bank or transfers between SWP long-term contractors and/or other agencies, including CVP contractors;
- establishing conjunctive-use programs;
- using SWP funds to develop local water supplies; and
- investigating and evaluating storage projects.

State Water Project Conveyance

The Department arranges for the temporary transfer of water through SWP facilities for the SWP long-term contractors, as well as for other agencies. These transfers can occur in three different ways: (1) water exchanges either among the SWP long-term contractors or among contractors and non-SWP contracting entities; (2) entitlement water transfers among long-term SWP contractors; or (3) transfers of nonproject water to the non-SWP and the SWP agencies.

CALFED Bay-Delta Program—Water Transfer Program

The Department actively participated in the formulation of CALFED's Water Transfer Program through

the Bay-Delta Advisory Council Water Transfer Work Group and the Transfers Agency Group. The program proposed a framework of actions, policies, and processes to facilitate water transfers and further

Environmental Policy Acts

The National Environmental Policy Act (Title 42 United States Code sections 4321-4370 [1970]) and the California Environmental Quality Act (California Public Resources Code sections 21000-21177 [1970]) require government agencies to document and consider environmental consequences of their actions in their decision-making process. NEPA states that it is the goal of the federal government to use all practicable means consistent with other considerations of national policy to protect and enhance the quality of the environment. All federal agencies must prepare an environmental impact statement, including a discussion of mitigation measures and alternatives, for actions significantly affecting environmental quality.

The California Environmental Quality Act is patterned after NEPA. According to CEQA, agencies are required to (1) disclose, through an environmental impact report, the significant effects proposed projects would have on the environment; and (2) search for ways to reduce or avoid environmental damage.

CEQA applies to projects directly undertaken, funded, or approved by State or local agencies. NEPA applies to projects directly undertaken, funded, or approved by federal agencies. The Department conducts many projects in cooperation with federal agencies. In those cases both CEQA and NEPA must be followed.

NEPA requires that mitigation measures and alternatives be disclosed to the public in the Environmental Impact Statement, but it does not generally require federal agencies to adopt such mitigation measures or alternatives. CEQA, on the other hand, does impose substantive duties on all California government agencies approving projects with significant environmental impacts to adopt alternatives or mitigation measures that they find to be feasible to substantially lessen these impacts, unless there are overriding reasons why they cannot. When a project is subject to both CEQA and NEPA, both laws encourage the agencies to cooperate in planning the project and preparing joint environmental documents.

Through the environmental review process, citizens can learn about those significant effects and, if the project is approved, the reasons for approving the project. The review process requires agencies to

- describe the proposed project;
- identify the lead and cooperating agencies involved in the project;
- determine the scope of study with responsible agencies and/or the public;
- prepare and distribute a draft EIS or EIR;
- respond to comments received on the draft;
- prepare the final EIS or EIR;
- make findings and adopt feasible alternatives or mitigation measures to avoid significant effects, if applicable;
- adopt a monitoring plan to ensure compliance with mitigation measures; and
- prepare a list of permits required to implement the project if the project is approved.

The scoping phase, which occurs early in the review process, is particularly important because it enables government agencies to identify issues and topics to be considered when preparing the report. Information gathered in the scoping phase helps agencies identify and evaluate reasonable alternatives; identify potential environmental impacts of the project; determine data and information needed; develop a work schedule; and allocate resources for preparing and distributing the draft environmental document for public review and comment.

NEPA requires a lead agency to involve the public during scoping, while CEQA does not. CEQA, however, does encourage public involvement at this stage. Members of the public may raise issues during the scoping phase and not just after the draft environmental document is prepared. Thus, the CEQA process leads to changes in projects through the development, consideration, and adoption of alternatives or enforceable mitigation measures to avoid or reduce any potential significant adverse effects on the environment.

develop a statewide water transfer market. The program document describes the relationship of water transfers to other water management actions and programs, discusses existing laws and statutes, such as Water Code Section 1810 *et seq.*, and identifies issues and problems related to transfers. The document also makes recommendations to resolve these issues and suggests strategies to implement these recommendations. In June 1999, CALFED released its Draft PEIS/EIR. The Water Transfer Program is one of eight program elements developed for the programmatic EIR/EIS. As part of the Water Transfer Work Group, Department staff, along with other agencies, assisted SWRCB in the formulation and publication of *A Guide to Water Transfers* (July 1999 draft). It was produced to help people understand the process and provide information needed to complete water transfers and to help foster voluntary transfers of water through a better understanding of the California Water Code and the existing regulations governing water transfers. Although all parties who reviewed this document did not agree on every conclusion and discussion in the guide, they encouraged its publication in order to provide a resource for information.

CALFED Bay-Delta Program—In-Delta and Off-Aqueduct Storage Element of the Integrated Storage Investigation Program

OSWPP and Division of Planning and Local Assistance are assisting CALFED with ISI. CALFED initiated ISI as part of its ongoing evaluation of the appropriate role of storage alternatives in the CALFED solution. ISI will evaluate surface storage, groundwater storage, power facility reoperation, and the potential for conjunctive-use operations. ISI will also identify and evaluate barriers to fish passage that may be modified or removed. One element of ISI's surface storage investigations is the In-Delta and Off-Aqueduct Storage Study.

The In-Delta and Off-Aqueduct Storage Study will evaluate five reservoir sites (shown in Table 7-1), some of which are storage islands in the Delta and surface storage reservoirs adjacent to the State and federal aqueducts south of the Delta.

**Table 7-1
Potential Reservoir Sites for In-Delta and Off-Aqueduct Storage**

<i>Project/Location</i>	<i>Type of Reservoir</i>	<i>Gross Storage Capacity (TAF)</i>
In-Delta In-Delta Storage Project/San Joaquin County	Island storage in the Delta	230
Off-Aqueduct – South of Delta Ingram Canyon Reservoir/ Stanislaus County	Off-stream storage	333 to 1,201
Los Vaqueros Enlargement/ Contra Costa County		Additional 965
Panoche Reservoir/San Benito and Fresno Counties		160 to 3,100
Quinto Creek Reservoir/Merced County		332 to 381

OSWPP will coordinate these evaluation studies and produce reports on the five sites. The reports will include the scope of each project, development of alternatives, operations studies, feasibility evaluation, environmental considerations, and water quality impacts. The resulting data will be incorporated into and become the basis of the reports. These reports will also include project descriptions, costs estimates, facilities description, and geologic investigations and findings. The facilities description will include layout of dams, embankments, levees, conveyance channels, siphons, and pumping-generating plants. Other issues that will be considered include power availability, road and utility relocations, pipelines, and right-of-way.

Environmental documentation will deal with existing biological inventories (Department of Fish and Game, U.S. Fish and Wildlife Service) and studies for these or similar areas. Operation studies will utilize the latest hydrology, water quality, and flow standards for the Sacramento-San Joaquin Bay-Delta areas currently under consideration by SWRCB.

In-Delta storage could provide significant operational flexibility which, in turn, would enhance water

Water Code Section 1810 *et seq.*

1810. Notwithstanding any other provision of law, neither the state, nor any regional or local public agency may deny a bona fide transferor of water the use of a water conveyance facility which has unused capacity, for the period of time for which that capacity is available, if fair compensation is paid for that use, subject to the following:

- (a) Any person or public agency that has a long-term water service contract with or the right to receive water from the owner of the conveyance facility shall have the right to use any unused capacity prior to any bona fide transferor.
- (b) The commingling of transferred water does not result in a diminution of the beneficial uses or quality of the water in the facility, except that the transferor may, at the transferor's own expense, provide for treatment to prevent the diminution, and the transferred water is of substantially the same quality as the water in the facility.
- (c) Any person or public agency that has a water service contract with or the right to receive water from the owner of the conveyance facility who has an emergency need may utilize the unused capacity that was made available pursuant to this section for the duration of the emergency.
- (d) This use of a water conveyance facility is to be made without injuring any legal user of water and without unreasonably affecting fish, wildlife, or other instream beneficial uses and without unreasonably affecting the overall economy or the environment of the county from which the water is being transferred.

1811. As used in this article, the following terms shall have the following meanings:

- (a) "Bona fide transferor" means a person or public agency as defined in Section 20009 of the Government Code with a contract for sale of water which may be conditioned upon the acquisition of conveyance facility capacity to convey the water that is the subject of the contract.
- (b) "Emergency" means a sudden occurrence such as a storm, flood, fire, or an unexpected equipment outage impairing the ability of a person or public agency to make water deliveries.

- (c) "Fair compensation" means the reasonable charge incurred by the owner of the conveyance system, including capital, operation, maintenance, and replacement costs, increased costs from any necessitated purchase of supplemental power, and including reasonable credit for any offsetting benefits for the use of the conveyance system.
- (d) "Replacement costs" means the reasonable portion of costs associated with material acquisition for the correction of unrepairable wear or other deterioration of conveyance facility parts which have an anticipated life which is less than the conveyance facility repayment period and which costs are attributable to the proposed use.
- (e) "Unused capacity" means space that is available within the operational limits of the conveyance system and which the owner is not using during the period for which the transfer is proposed and which space is sufficient to convey the quantity of water proposed to be transferred.

1812. The state, regional, or local public agency owning the water conveyance facility shall in a timely manner determine the following:

- (a) The amount and availability of unused capacity.
- (b) The terms and conditions, including operation and maintenance requirements and scheduling, quality requirements, term or use, priorities, and fair compensation.

1813. In making the determinations required by this article, the respective public agency shall act in a reasonable manner consistent with the requirements of law to facilitate the voluntary sale, lease, or exchange of water and shall support its determinations by written findings. In any judicial action challenging any determination made under this article the court shall consider all relevant evidence, and the court shall give due consideration to the purposes and policies of this article. In any such case the court shall sustain the determination of the public agency if it finds that the determination is supported by substantial evidence.

1814. This article shall apply to only 70 percent of the unused capacity.

supply reliability and ecosystem benefits. The In-Delta and Off-Aqueduct Storage Study must carefully evaluate the unique attributes of Delta storage to assess possible impact to water quality, the ecosys-

tem, existing water projects, and agricultural land. It must also carefully evaluate the attributes of off-aqueduct storage, which could include the enhancement of operational flexibility by providing

additional opportunities to export Delta water when optimum biologic and water quality conditions occur in the Delta.

These studies are intended to narrow the list of potential reservoir sites based on engineering, economic, and environmental considerations.

Conjunctive-Use Program

The term “conjunctive use” denotes a set of water management techniques designed to maximize the complementary use of surface and groundwater storage in order to provide improved water supply reliability. Conceptually, surplus surface water is used to recharge groundwater basins in wetter years. The stored groundwater is extracted when needed to augment diminished surface water supplies during dry years. If they are thoughtfully designed and implemented, conjunctive-use projects can be operated with minimal impact to the environment or to other water users. However, the groundwater component of conjunctive use has become increasingly controversial as it gains more prominence in both the CALFED process and as part of various water transfer proposals. As a result, many counties, particularly in the Sacramento Valley, have adopted ordinances designed to regulate water transfers that use a groundwater substitution technique.

The Department perceives conjunctive use as somewhat of a double-edged sword. On the one hand, in dry years there is the potential for cooperative projects with local agencies to augment existing SWP supplies. On the other hand, given the frequent interconnection of surface and groundwater, conjunctive use and other groundwater development projects, if poorly designed, have the potential to adversely effect SWP supplies. To minimize this adverse potential, increased efforts are required to evaluate water transfer, conjunctive use, and other proposals that could impact the reliability of SWP supplies. The Department’s Sacramento Valley Conjunctive-Use Program takes into account both the positive and potentially negative aspects of conjunctive use.

American Basin

Efforts to negotiate an agreement for a conjunctive-use project with the Natomas Central and Pleasant Grove-Verona Mutual Water Companies continue. These negotiations are being undertaken as part of the Opt-in Pilot Program between the Department and the SWP contractors. Under this program, individual SWP contractors have the option of funding project activities in return for receiving the water supply developed by a project. During 1999, six SWP contractors participated in the American Basin Project: (1) The Metropolitan Water District of Southern California; (2) Solano County Water Agency; (3) Santa Clara Valley Water District; (4) Napa County Flood Control and Water Conservation District; (5) Alameda County Flood Control and Water Conservation District-Zone 7; and (6) Castaic Lake Water Agency. The participants negotiated a set of Principles of Participation that set forth a staged approach to develop up to 47,000 acre-feet of dry-year water supply. Using existing facilities, the first stage is designed for early implementation to provide up to 10,000 acre-feet. A second stage entails the construction of a new Sacramento River diversion and new conveyance features in Natomas Central. Both phases use water provided by Natomas to achieve in-lieu recharge. A possible third stage involving storage of the SWP water is being considered. Following the adoption of these Principles of Participation, the participants began negotiation of a project agreement.

Lower Colusa Basin

The Department continues to investigate the conjunctive-use potential of the Lower Colusa Basin in cooperation with Reclamation District No. 108, Colusa County Water District, and the Yolo-Zamora Water District. A proposed project could yield up to 34,000 acre-feet of dry-year water supply for the SWP. During 1999, activities focused on completion of the monitoring-well network being developed, detailed hydrogeologic characterization of the basin, and the development of a groundwater flow model. A cooperative project to develop a Global Positioning System network to evaluate future land subsidence in Yolo County was also completed.

Butte Basin

The Department's efforts in Butte County focused on improving the technical understanding of the Butte Basin groundwater system and on building relationships with local interests. The Department cooperated with the Butte County Department of Water and Resources Conservation to design and develop a monitoring-well network for the basin and to install two extensometers to measure potential land subsidence. The Department also provided technical assistance to the County and to the Butte Basin Water Users Association, including assistance in the evaluation of the Butte Basin groundwater model developed for the association. In addition, the Department completed an evaluation of alternative means of delivering water from Thermalito Afterbay to the Cherokee Strip area for in-lieu recharge, as part of a potential conjunctive-use project with Western Canal Water District. There is significant potential to develop conjunctive-use projects to benefit the SWP in the Butte Basin, provided institutional barriers can be overcome.

Institutional Concerns

Local entities and individuals in the Sacramento Valley and elsewhere are faced with a confusing array of proposals and activities that are sometimes seen as threats to their water supplies and futures. These include the Department's conjunctive use and water transfer programs; CALFED's Bay-Delta Program; the SWRCB's Delta water right hearings and related settlement attempts; activities of USBR in implementing the CVP Improvement Act, contract-renewal negotiations; and other proposals.

Local agencies are increasingly active in developing groundwater management programs and asserting control over water supply development and management activities. The Department works with local agencies and interested parties by providing technical and other assistance to help alleviate local anxieties and build consensus for local and regional conjunc-

tive use. Concurrently, the Department actively monitors and evaluates proposed water transfers and other groundwater management activities to protect the existing SWP water supply.

Local Water Supply Projects

Local projects to augment water supply may be financed with SWP funds and become units of the SWP if the Department determines that the projects are structurally, economically, financially, and contractually feasible as well as environmentally acceptable. SWP contractors benefit from increased water supplies or reduced demands resulting from the projects.

Should construction costs of a local project exceed available SWP funds, local participation in financing the construction will be required. In addition, SWP funding will not exceed actual construction costs, and a local project will not become a unit of the SWP until all participants sign an agreement.

For a project to be financed by the SWP, the Department must be assured that

- appropriate water supply contracts will be amended;
- yield developed by a local project as a unit of the SWP will become part of the SWP yield, whether for the life of the project or for a prescribed interim period; and
- the local project will not adversely affect the costs of water deliveries to nonparticipating SWP contractors.

The Department conducts a feasibility study of local water supply projects only when conceptual and reconnaissance reports support the project and SWP contractors agree that the project is advantageous.

At this time, no local water supply projects are being considered by the Department.

Central Valley Project Improvement Act of 1992

The Central Valley Project Improvement Act (PL 102-575; 106 Stat. 4706) made protection, restoration, and enhancement of fish and wildlife a major purpose of CVP. Because it requires specific water supply actions, CVPIA directly affects the joint activities of CVP and SWP. The act indirectly influences SWP operations by addressing several Delta environmental issues.

CVPIA is designed to (1) protect, restore, and enhance fish, wildlife, and associated habitats in the Central Valley and Trinity River basins; (2) address impacts of CVP on fish, wildlife, and associated habitats; (3) improve operational flexibility of CVP; (4) encourage expanded use of voluntary water transfers and water conservation; (5) contribute to efforts to protect the Sacramento-San Joaquin Delta and estuary; and (6) achieve a reasonable balance among competing demands for CVP water, including fish and wildlife, agricultural, municipal, and power uses.

In addition to imposing further limitations on new and renewed CVP contracts and encouraging voluntary transfers of CVP water, CVPIA requires the implementation of a program to ensure that by 2002, natural production of anadromous fish will be sustainable at population levels twice the average sustained from 1967 to 1991. CVPIA also requires the dedication and management of an additional 800,000 acre-feet of CVP yield for fish and wildlife needs.

CVPIA also specifies measures to restore fish and wildlife and their habitat. Several measures—including installing a structural temperature control device at Shasta Dam, constructing specified Delta barriers, and acquiring supplemental wildlife refuge water—require cost sharing by the State of California. USBR is establishing guidelines and procedures to implement CVPIA requirements. The Department works closely with USBR as these programs develop to manage any effects on SWP operations and minimize adverse impacts to threatened and endangered species.

Information in this chapter was contributed by the State Water Project Analysis Office, the Division of Planning and Local Assistance, and the Office of State Water Project Planning.

Chapter 8

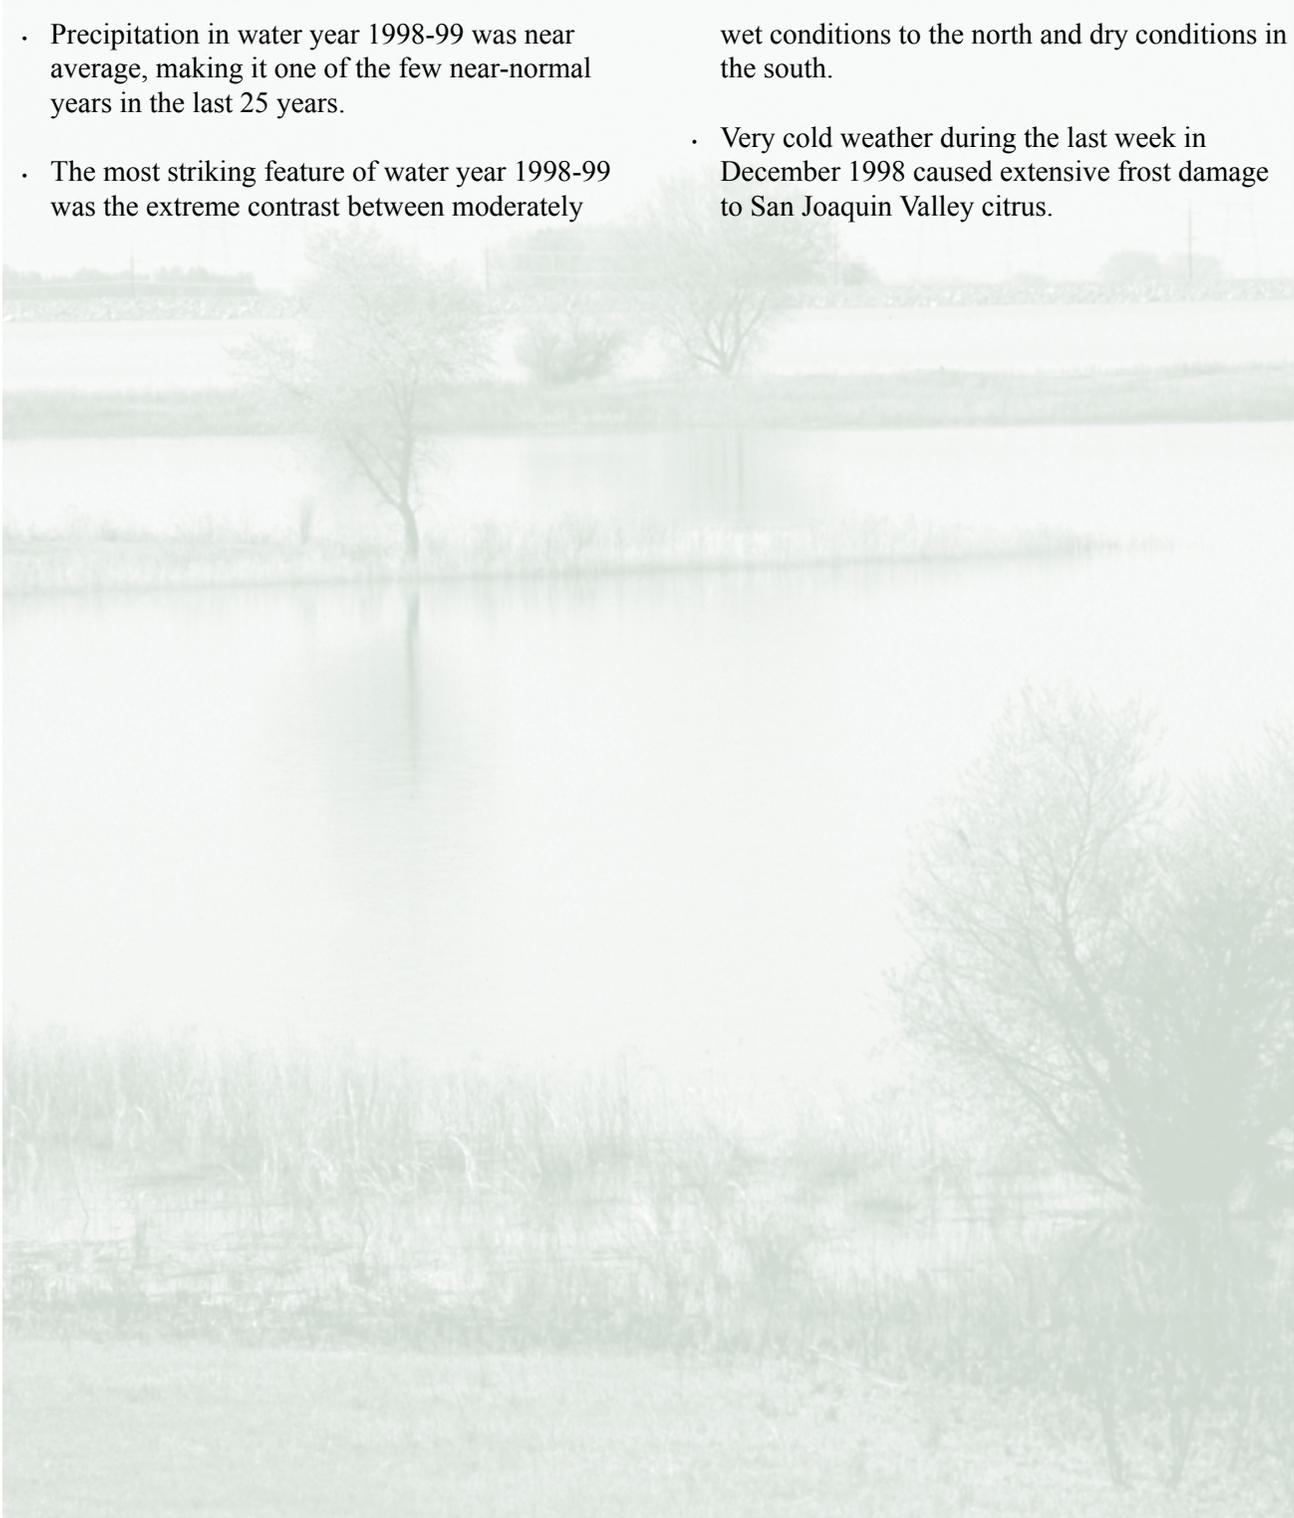

Water Supply and Allocation

Inlet works channel at
Silverwood Lake

Significant Events

- Precipitation in water year 1998-99 was near average, making it one of the few near-normal years in the last 25 years.
- The most striking feature of water year 1998-99 was the extreme contrast between moderately wet conditions to the north and dry conditions in the south.
- Very cold weather during the last week in December 1998 caused extensive frost damage to San Joaquin Valley citrus.

To meet contracted obligations to the State Water Project long-term water supply contractors, the Department of Water Resources monitors precipitation, calculates runoff, and operates storage facilities as required.

During each water year, from October 1 through September 30, the Department monitors and records precipitation, runoff, and reservoir water storage.

Water Year 1998-99

Precipitation

Water year 1998-99 was wet in Northern California, but less than the previous very wet year. Surface temperature patterns in the eastern tropical Pacific switched from warmer to cooler than normal—from El Niño to La Niña. California precipitation followed a typical La Niña pattern of dry in Southern California and above normal in the northern part of the State. The north to south gradient in annual precipitation, snowpack, and runoff in the southern Sierra Nevada was one of the steepest in history. Figure 8-1 shows statewide precipitation by hydrologic region. The southern tier was very dry.

Although some stations on the Napa and Sacramento Rivers exceeded flood stage briefly on February 7 and February 9, water year 1998-99 was a mild year for flood control.

The first part of October 1998 was drier than average, but a significant storm brought rain near the end of the month. Northern Sierra precipitation was about half the monthly average.

November was quite wet, nearly double normal in the northern Sierra. Major weekend storms during the latter half of November brought rains to most portions of the State, but were heavier in the north. December started wet, then turned dry with some very cold weather during the last week of the month. It was the coldest winter since the big freeze of December 1990. The extreme cold caused extensive frost damage to San Joaquin Valley citrus.

Statewide precipitation for the first 3 months of the water year, October through December 1998, was near average, with a pronounced gradient from above average in the north to below average in the south.

After a 30-day dry spell, storms resumed in the middle of January 1999. Estimated statewide precipitation for the month was 95 percent of average, with the seasonal accumulation since October 1, 1998, at 85 percent.

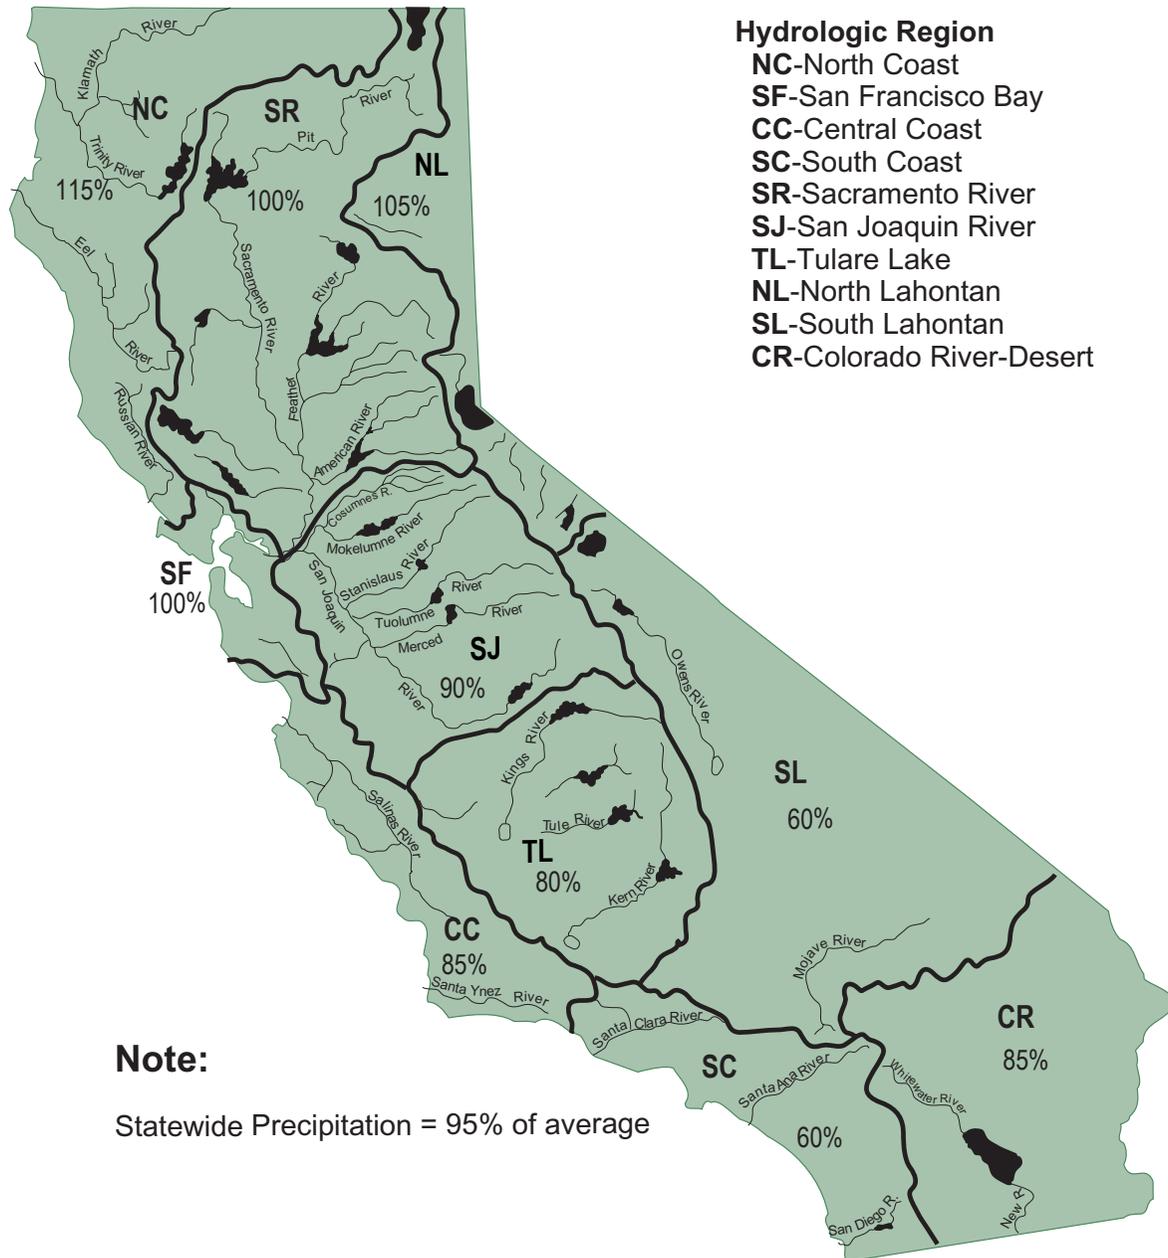

More storms in February 1999 resulted in 150 percent of average precipitation statewide, ranging from 200 percent in the northern regions to a dry 30 percent in the southeastern regions. This raised the statewide seasonal percentages to average.

The February storms caused the highest river stages of the year with significant weir overflow into the Sacramento River bypass system about mid-month. The storms also boosted the snowpack to above average levels.

Precipitation in March was about 80 percent of average statewide. The North Coast and Central Coast had above normal rain but the southern Sierra and Southern California were much below average. The April 1 snowpack was 110 percent overall, but only 60 percent of average in the Tulare Lake region.

Strong shower activity during the first half of April in the coastal and desert regions boosted statewide precipitation to above average (125 percent) for the month. However, normally wetter areas of Northern California had less than average precipitation. The storms were cool and the mountain snowpack continued to increase until near the middle of the month when a week of fair, warm weather began the melting process.

Figure 8-1
Statewide Precipitation by Hydrologic Region, 1998-99 Water Year, in Percentage of Average

May was dry and cooler than normal. June was also dry in the northern part of the State, but some heavy showers raised precipitation totals in the southern half. July and August were near normal overall with unseasonable showers in Southern California during July and some heavy thunderstorms in Northern California during August. Intense lightning on August 22 and 23 started wildfires in Northern California. September was dry (about 25 percent of average precipitation). The water year closed with a statewide estimate of 95 percent of average precipitation.

Runoff

Runoff in Central Valley rivers was less than water year 1997-98, but still well above average, except in the southern end of the Sierra from the Merced River south. The Sacramento River Index runoff was just over 21 million acre-feet, making it the fifth wet year in a row. San Joaquin River Index runoff was slightly under 6 million acre-feet, just over average. The year was classified as “above normal,” and as a result, water year 1998-99 ended the run of 4 wet years on the San Joaquin River system.

First Quarter Water Year 1999-00

Precipitation

October was mostly dry at the beginning of water year 1999-00. However, during the last week of the month a powerful Pacific storm brought substantial rain to Northern California mountains and doused the lingering wildfires in the region. The San Joaquin Valley and Southern California remained dry at the end of the month.

November continued the strong north to south gradient in the State. Precipitation during the month was near average in the north but progressively much below average in the south. Seasonal accumulations at the end of the month were average in the northern Sierra, but dry weather in the south lowered the statewide seasonal average to 70 percent.

December was one of the State’s driest winter months with only 15 percent of normal monthly precipitation. By the end of the month northern Sierra seasonal precipitation declined to 60 percent of average. The statewide percentage had fallen to about 40 percent and the mountain snowpack was only

about one-quarter of the average December 31 water content, and 10 percent of the average April 1 snowpack.

SWP Storage

The SWP operates a complex system of 28 dams and reservoirs to collect and store water for future deliveries. Lake Oroville is the first of two primary SWP conservation facilities. Inflow to Lake Oroville comes from the Feather River.

San Luis Reservoir, in the central part of the State, is the second primary SWP conservation facility and derives its inflow from pumping at Gianelli Pumping-Generating Plant. San Luis is off-stream storage, with most water in the reservoir pumped in from late fall to early spring, temporarily stored, and then later released back to the aqueduct to meet water contractor peaking demands in the summer months. The remaining 26 dams and reservoirs regulate the stored water supply into water delivery patterns designed to fit local needs.

Reservoir storage in the SWP at the end of the 1998-99 water year was 107 percent of average, compared to 135 percent of average in water year 1997-98. Total 1998-99 storage in major SWP reservoirs was 3.66 million acre-feet on September 30, 1999, about 730 thousand acre-feet less than storage at the same time in water year 1997-98. September 30 storage at Lake Oroville was 2.43 million acre-feet, about 404,000 acre-feet less than last year. The State’s share of San Luis Reservoir storage was 591,796 acre-feet, compared to 900,063 acre-feet last year. The combined storage in southern reservoirs was 640,124 acre-feet on September 30, compared to 662,000 acre-feet at the end of the 1997-98 water year.

Total storage in major SWP reservoirs was about 3.53 million acre-feet at the end of calendar year 1999, compared with 4.4 million acre-feet in 1998. The State’s share of San Luis Reservoir storage was about 717,426 acre-feet, compared with 1.07 million acre-feet at the end of 1998. The combined storage in southern reservoirs was about 625,000 acre-feet on December 31, 1999, compared with 628,000 acre-feet in 1998.

The following information about these reservoirs, including amounts of unimpaired runoff to Lake Oroville and storage levels for SWP conservation and other storage facilities, is based on the 1998-99 water year.

Lake Oroville. Lake Oroville, the keystone of the SWP, has a maximum capacity of 3,537,580 acre-feet. Runoff from the Feather River drainage is collected and stored in the reservoir for release to the Sacramento-San Joaquin Delta through Oroville Dam, Thermalito Diversion Dam, and Thermalito Afterbay.

Lake Oroville inflow for the 1998-99 water year totaled about 4.94 million acre-feet—107 percent of average. Minimum storage occurred December 31, 1999, at 2,186,332 acre-feet—62 percent of its capacity. Maximum storage occurred June 13, 1999, at 3,481,007 acre-feet—about 98 percent of capacity. See Figures 8-2 and 8-3 for monthly and cumulative inflow, respectively, into Lake Oroville.

Total inflow into Lake Oroville during the 1999 calendar year was 4,487,783 acre-feet. Lake Oroville storage at the end of 1999 was 2,186,332 acre-feet. Figure 8-4 compares end-of-month storage in Oroville Reservoir for the 1998 and 1999 calendar years.

San Luis Reservoir. The Department and the U.S. Bureau of Reclamation operate San Luis Reservoir jointly according to operating procedures adopted in June 1981. San Luis Reservoir has a normal operating capacity of 2,027,840 acre-feet. The SWP share of capacity is 1,062,183 acre-feet.

At the beginning of the 1998-99 water year, San Luis Reservoir contained 1,617,766 acre-feet—80 percent of its capacity. The SWP share was 903,992 acre-feet. By April 14, 1999, San Luis Reservoir reached its maximum storage for 1999 at 2,029,233 acre-feet—100 percent of normal maximum operating capacity. The highest end-of-month SWP share of storage was in January 1999 at 1,104,028 acre-feet (Figure 8-5), with the SWP storing some water in the vacant USBR share of storage.

Lake Del Valle. Lake Del Valle, situated off the South Bay Aqueduct, functions primarily as a storage

facility for later water delivery in Santa Clara and Alameda Counties. At the beginning of the 1998-99 water year, Lake Del Valle held 30,645 acre-feet—about 40 percent of its maximum capacity of 77,106 acre-feet. Its highest storage occurred May 19, 1999, at 39,752 acre-feet.

By the end of the 1999 water year, on September 30, 1999, storage in Lake Del Valle had dropped to 35,084 acre-feet—45 percent of maximum capacity. Releases to Arroyo Del Valle and South Bay Aqueduct from Lake Del Valle had totaled 10,397 acre-feet for the 1998-99 water year.

Southern Reservoirs. During normal operating conditions, the Department maintains its four southern reservoirs—Pyramid, Castaic, and Silverwood Lakes and Lake Perris—at or near full operating capacity to ensure uninterrupted delivery of water to Southern California contractors.

At the beginning of the 1998-99 water year, these reservoirs held 660,621 acre-feet—94 percent of combined normal maximum operating capacity of 701,321 acre-feet. At the end of the water year, they held 640,124 acre-feet—91 percent of combined normal maximum operating capacity.

Diversions from the Delta

The SWP diverts water from the Sacramento-San Joaquin Delta through Banks and Barker Slough Pumping Plants for delivery to contractors and SWP storage facilities. In 1999, the SWP diverted 2,706,835 acre-feet at Banks Pumping Plant, including a combined total of 60,283 acre-feet of Central Valley Project and Cross Valley Canal water wheeled by the Department. Figure 8-6 shows the amounts of water pumped each month in 1999 at Banks Pumping Plant; Figure 8-7 shows the monthly amounts of water diverted from the Delta by the SWP and CVP in 1999. CVP diverts water to similar areas from the Delta through Tracy Pumping Plant. CVP diverted about 2,542,202 acre-feet at Tracy Pumping Plant in 1999. Combined Delta exports include all of these plants.

From Banks Pumping Plant, water is delivered either to the South Bay area through the South Bay

Water Diverted from the Sacramento-San Joaquin Delta by the State Water Project and Central Valley Project in 1999, by Month

Aqueduct or to the San Joaquin Valley, Central Coastal, and Southern California areas through the California Aqueduct. From Barker Slough Pumping Plant, water is delivered to the North Bay Aqueduct.

On October 23, 1999, and continuing through November 16, the Department began pumping Cross Valley Canal water at Banks Pumping Plant for USBR in accord with the Cross Valley Canal Wheeling agreements. The initial rate was about 700 acre-feet per day during on-peak hours. Amount pumped during this period was about 19,423 acre-feet.

Combined SWP and CVP Delta exports were highest at around 22,000 acre-feet per day during the months of July, August, and September. Monthly Delta exports in 1999 gradually increased from about 280,461 acre-feet in January to about 703,114 acre-feet in August, before dropping to about 396,753 acre-feet in December. Delta exports totaled about 5.39 million acre-feet for 1999.

The SWP also diverted 44,661 acre-feet at Barker Slough Pumping Plant for delivery to North Bay Aqueduct water contractors.

In the San Joaquin Valley near Kettleman City, the existing Coastal Branch of the Aqueduct serves agricultural areas west of the California Aqueduct, including municipal and industrial water users in San Luis Obispo and Santa Barbara Counties. In 1999, total water pumped through Dos Amigos Pumping Plant to the San Joaquin Valley totaled 4,073,298 acre-feet. Included in that amount are 19,672 acre-feet for CVC water delivered to Westlands Water District. Also included was 1,245,782 acre-feet federal share of pumping at Dos Amigos. Figure 8-8 shows the State's share of water pumped each month.

In 1999, water pumped through Edmonston Pumping Plant for delivery to Southern California totaled 1,000,571 acre-feet. Figure 8-9 shows the amount of water pumped each month.

Information for this chapter was provided by the Division of Flood Management, the Division of Operations and Maintenance, and the State Water Project Analysis Office.

Chapter 9

Water Contracts and Deliveries

East Branch Aqueduct with mountains
in the background

Significant Events

- On October 1, 1998, SWP long-term contractors submitted initial requests for 1999 entitlement deliveries totaling 3.42 million acre-feet. The Department approved deliveries of 2.24 million acre-feet on November 24, 1998, resulting in an initial entitlement allocation for 1999 of 55 percent. Improved water conditions increased the 1999 allocation of entitlement water to 2.44 million acre-feet or 60 percent on February 10, 1999. As a result of additional improvements in water conditions and a reduction in SWP contractor requests to 3.19 million acre-feet, allocations were further increased to 100 percent on March 10, 1999, and remained at that level for the rest of 1999.
- In 1999, 4,095,269 acre-feet of water were conveyed to 27 long-term contractors and 17 other agencies. That amount includes 2,738,891 acre-feet of entitlement water; 158,070 acre-feet of Article 21 water, and 4,324 acre-feet of entitlement-related water for recreation and fish and wildlife.
- The Department executed an amendment to the water supply contract between the County of Butte and the Department to increase Butte's Table A annual entitlements to 2,890 acre-feet for 1999. In 2000, Butte's Table A annual entitlements will remain at 2,890 acre-feet and, in 2001, will increase to the maximum of 27,500 acre-feet.
- The Department executed a Monterey Amendment with Ventura County Flood Control District as Amendment Number 12 to VCFCD's Water Supply Contract. Plumas County Flood Control and Water Conservation District and Empire West Side Irrigation District remain the only long-term State Water Project contractors that have not signed the Monterey Amendment.
- The Department executed two separate amendments to the water supply contracts of Kern County Water Agency and Alameda County Flood Control and Water Conservation District-Zone 7, providing for the permanent transfer of 7,000 acre-feet and 15,000 acre-feet of KCWA's SWP entitlement to ACFCWCD-Zone 7. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.
- The Department executed amendments to the water supply contracts of KCWA and Castaic Lake Water Agency that provide for the permanent transfer of 41,000 acre-feet of KCWA's SWP entitlement to CLWA. The transfer is consistent with implementation of the Monterey Amendment.
- The Department executed amendments to the water supply contracts of KCWA and Palmdale Water District that provide for the permanent transfer of 4,000 acre-feet of KCWA's SWP entitlement to PWD. The transfer is consistent with implementation of the Monterey Amendment.

The long-term water supply contracts for water service from the State Water Project between the Department and 29 local agencies are basic to the project's construction and operation. In return for State financing, constructing, operating, and maintaining facilities needed to provide water service, the agencies contractually agreed to repay all associated SWP capital and operating costs.

The Department delivers water to SWP contractors according to long-term water supply contracts, which are amended as needed. The contracts, among other things, specify amounts of water that the Department may deliver to SWP contractors every year. During 1999, the Department executed 10 amendments to these contracts.

The Department also enters into miscellaneous agreements with SWP contractors and other agencies—which may be amended periodically—to

convey SWP and non-SWP water through the California Aqueduct, approve turnout construction along SWP facilities, and establish turnout operation and maintenance regulations. During 1999, the Department executed 16 water conveyance/storage agreements, and 3 turnout agreements with SWP contractors.

Detailed information about contracts and amendments follows.

Long-Term SWP Water Supply Contracts

The first water supply contract was signed with the Metropolitan Water District of Southern California on November 4, 1960. The contract was negotiated by the Department and MWD according to terms of the contracting principles for water service contracts announced by Governor Edmund G. Brown on January 20, 1960.

The MWD contract became the prototype for all water contracts; by the end of 1967, 31 agencies had contracted for water. In addition, a water supply contract was executed with the City of West Covina in December 1963, but was terminated in August 1965; the city's water entitlement was transferred to MWD through an amendment to the district's long-term contract with the Department. Long-term contracts with Hacienda Water District and Devil's Den Water District were also terminated when those districts transferred their water entitlements, through contract amendments, to Tulare Lake Basin Water Storage District (1981) and Castaic Lake Water Agency (1992), respectively. Today the SWP has long-term water supply contracts with 29 agencies. Those contracts have been amended periodically to incorporate mutually desired modifications.

All water contracts signed in the 1960s included an estimate of the date water would first be delivered and a schedule of the amount of water the agency could expect to be delivered annually (annual entitlement). That amount was designed to increase gradually until the maximum amount of annual entitlement was reached. The total combined maximum annual entitlement for all water contracting agencies was initially 4,230,000 acre-feet, assuming full development of the SWP.

The contracts were initially designed to be valid for 75 years or until all bonds sold as part of the California Water Resources Development Bond Act were repaid, whichever period was longer. As a result of amendments to contracts in the 1990s, the current combined maximum annual entitlement totals 4,172,786 acre-feet, and the contracts are in effect for the longest of the following periods: (1) the project repayment period, which extends to the year 2035; (2) 75 years from the date of the contract; or (3) the period ending with the latest maturity date of any bond used to finance the construction costs of project facilities.

Amendments to Long-Term SWP Water Supply Contracts

All the original contracts signed by the Department and local agencies have been previously amended to incorporate mutually desired changes. Most amendments fall under the following five general categories:

- revision of Table A, “Annual Entitlements,” of water supply contracts;
- allocation of costs and benefits for the enlargement or extension of the East Branch and extension of the Coastal Branch of the California Aqueduct;
- purchase of excess capacity in the California Aqueduct;
- provisions to allow contractors, during certain conditions, to carry over undelivered entitlement water from one year for delivery in the next year; and
- implementation of Monterey Agreement principles.

Table 9-1 lists the categories of amendments by contractors.

The following long-term contracts were amended during 1999.

Alameda County Flood Control and Water Conservation District-Zone 7. The Department executed Amendment Number 19 to the Water Supply Contract between ACFCWCD-Zone 7 and the Department on December 21, 1999. The Amendment provided for the permanent transfer of 7,000 acre-feet of SWP agricultural entitlement by ACFCWCD-Zone 7 from KCWA and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Alameda County Flood Control and Water Conservation District-Zone 7. The Department executed Amendment Number 20 to the Water Supply Contract between ACFCWCD-Zone 7 and the Department on December 29, 1999. The Amendment provided for the permanent transfer of 15,000 acre-feet of SWP agricultural entitlement by ACFCWCD-Zone 7 from

KCWA and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

County of Butte. The Department executed Amendment Number 14 to the Water Supply Contract between Butte and the Department on February 26, 1999. The Amendment provided for increasing Butte’s Table A annual entitlements to 2,890 acre-feet for 1999. In 2000, Butte’s Table A annual entitlements will remain at 2,890 acre-feet. In 2001, Butte’s Table A annual entitlements will be increased to the maximum of 27,500 acre-feet.

Castaic Lake Water Agency. The Department executed Amendment Number 18 to the Water Supply Contract between CLWA and the Department on March 31, 1999. The Amendment provided for the permanent transfer of 41,000 acre-feet of SWP agricultural entitlement by CLWA from KCWA, acting on behalf of Wheeler Ridge-Maricopa Water Storage District, and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Kern County Water Agency. The Department executed Amendment Number 28 to the Water Supply Contract between KCWA and the Department on March 31, 1999. The Amendment provided for the permanent transfer of 41,000 acre-feet of SWP agricultural entitlement by KCWA, acting on behalf of WRMWSD, to CLWA and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Kern County Water Agency. The Department executed Amendment Number 29 to the Water Supply Contract between KCWA and the Department on December 29, 1999. The Amendment provided for the permanent transfer of 4,000 acre-feet of SWP agricultural entitlement by KCWA, acting on behalf of Belridge Water Storage District, to Palmdale Water

District and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Kern County Water Agency. The Department executed Amendment Number 30 to the Water Supply Contract between KCWA and the Department on December 21, 1999. The Amendment provided for the permanent transfer of 7,000 acre-feet of SWP agricultural entitlement by KCWA to ACFCWCD-Zone 7 and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Kern County Water Agency. The Department executed Amendment Number 31 to the Water Supply Contract between KCWA and the Department on December 29, 1999. The Amendment provided for the permanent transfer of 15,000 acre-feet of SWP agricultural entitlement by KCWA to ACFCWCD-Zone 7 and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Palmdale Water District. The Department executed Amendment Number 16 to the Water Supply Contract between PWD and the Department on December 29, 1999. The Amendment provided for the permanent transfer of 4,000 acre-feet of SWP agricultural entitlement by PWD from KCWA, acting on behalf of BWSO, and set forth conditions for the transfer. The transfer is consistent with implementation of the Monterey Amendment, which provides for the permanent transfer of up to 130,000 acre-feet of agricultural entitlement to urban agencies.

Monterey Amendments

The Monterey Amendments increase the reliability of existing water supplies; provide stronger financial management for the SWP; and increase water management flexibility, providing more tools for local water agencies to maximize use of existing facilities. Changes to SWP operations incorporated in the

Monterey Amendments include changes in determination of water allocations, transfer of entitlement and land, financial restructuring, and increased operational flexibility. The Monterey Amendments are discussed in detail in Chapter 1, *Summary of Significant Events*, of Bulletin 132-95.

On August 12, 1999, the Department executed one Monterey Amendment with Ventura County Flood Control District as Amendment Number 12 to VCFCO's Water Supply Contract. Plumas County Flood Control and Water Conservation District and Empire West Side Irrigation District remain the only long-term SWP contractors who have not signed the Monterey Amendment.

The Planning and Conservation League filed a lawsuit on December 27, 1995, challenging the California Environmental Quality Act compliance for the Monterey Amendment. A Sacramento County Superior Court judge later dismissed the lawsuit. PCL appealed the decision and the parties await the Court of Appeals decision. Additional information can be found in Chapter 6, *Legislation and Litigation*.

Miscellaneous Agreements with Long-Term SWP Contractors

Water Conveyance/Storage Agreements

During 1999, agreements were executed with long-term contractors as described below.

Alameda County Flood Control and Water Conservation District-Zone 7. The agreement, among ACFCWCD-Zone 7, KCWA, and the Department, provided for the delivery of a portion of ACFCWCD-Zone 7's 1999 entitlement water, Article 21 water, and other water supplies, to be stored in, and later recovered from, groundwater basins within KCWA, in accordance with the ACFCWCD-Zone 7 and Semitropic Water Storage District Banking Program Agreement. All return water is to be delivered to ACFCWCD-Zone 7 by December 31, 2035. This agreement, expected to be executed in March 2000, is in accordance with the provisions of the Monterey Amendment that encourage operational flexibility for the SWP, such as groundwater storage of SWP water outside a contractor's service area for later use within

the service area. During 1999, the Department delivered 20,000 acre-feet of ACFCWCD-Zone 7's 1999 SWP entitlement water and 2,910 acre-feet of Article 21 water for storage by SWSW.

Alameda County Water District. An agreement, executed March 3, 1999, among ACWD, KCWA, and the Department, provided for the delivery of a portion of ACWD's 1999 entitlement water, Article 21 water, and other water supplies, to be stored in, and later recovered from, groundwater basins within KCWA, in accordance with the ACWD and Semitropic Water Storage District Banking Program Agreement. All return water is to be delivered to ACWD by December 31, 2035. The Department, ACWD, and KCWA signed similar delivery agreements for 1996, 1997, and 1998. These agreements were in accordance with the provisions of the Monterey Amendment. During 1999, the Department delivered 13,720 acre-feet of ACWD's 1999 SWP entitlement water and 2,781 acre-feet of Article 21 water for storage by SWSW.

Dudley Ridge Water District. A letter agreement, dated July 24, 1999, and executed August 3, 1999, approved the delivery of up to 10,000 acre-feet of DRWD's 1999 Article 21 water and up to 10,000 acre-feet of DRWD's 1999 SWP entitlement water to the Kern Water Bank and the return of a like amount of water by December 31, 2009. The Department approved similar agreements in 1996, 1997, and 1998. During 1999, the actual amount of Article 21 water delivered to KWB was 1,321 acre-feet.

Dudley Ridge Water District. A letter agreement, among the Department, DRWD, and San Gabriel Valley Municipal Water District, approved the storage of up to 5,000 acre-feet of DRWD 1999 SWP entitlement water in SGVMWD. The return of the stored water will be accomplished through an exchange of SGVMWD's entitlement. In 1999, 3,500 acre-feet of DRWD's entitlement and 229 acre-feet of DRWD's Pool B purchase water were delivered to SGVMWD pursuant to this agreement. The letter agreement is expected to be executed in February 2000.

Empire West Side Irrigation District. A letter agreement executed April 6, 1999, between the

Department and EWSID allowed EWSID to take unscheduled water when the Delta is in excess conditions. EWSID took 176 acre-feet of unscheduled water in 1999.

Kern County Water Agency. A letter agreement dated July 20, 1999, and executed August 2, 1999, between the Department, KCWA, and Tulare Lake Basin Water Storage District approved the exchange of up to 9,000 acre-feet of KCWA's 1999 SWP entitlement to TLBWSD. The agreement facilitated transfers between KCWA, TLBWSD, the City of Fresno, and J. G. Boswell Company. The City of Fresno provided up to 9,000 acre-feet of its CVP water from the Friant-Kern Canal to KCWA prior to May 31, 1999; KCWA exchanged an equivalent amount of its 1999 SWP entitlement water to TLBWSD; TLBWSD delivered KCWA entitlement water to J. G. Boswell Company; and Boswell provided an equivalent amount of Kings River water to the City of Fresno. The actual amount exchanged was 9,000 acre-feet.

Kern County Water Agency. A letter agreement between the Department and KCWA approved the exchange of up to 12,500 acre-feet of KCWA 1999 SWP entitlement water for a like amount of CVP water to be acquired by Westlands Water District. SWP water will be delivered to WWD via Reach 7 of the California Aqueduct in Kings County for use within the SWP service area. In return, WWD will acquire a like amount of CVP (Friant Unit) water and deliver it to KCWA through its groundwater banking program by December 31, 1999. A total of 12,500 acre-feet was exchanged. The letter agreement is expected to be executed in January 2000.

Kern County Water Agency. A letter agreement dated April 9, 1999, between the Department and KCWA approved the transfer of up to 40,776 acre-feet of KCWA's 1999 SWP entitlement water to WWD. The agreement facilitated a water transfer from landholders within member units of the agency—Lost Hills Water District, Berrinda Mesa Water District, BWSW, and TLBWSD—to land they farmed in WWD. Similar transfers were approved by the Department in 1996, 1997, and 1998. The actual amount of water transferred from KCWA to WWD in 1999 was 40,776 acre-feet.

Kern County Water Agency. A letter agreement between the Department and KCWA approved the exchange of up to 11,000 acre-feet of KCWA's 1999 SWP entitlement water to WWD for a like amount of WWD's water delivered to KCWA. WWD acquired Kern River water from La Hacienda, Incorporated, and delivered it from Lake Isabella to KCWA's service area. In exchange, a like quantity of KCWA's 1999 SWP entitlement water was delivered to WWD's service area within Kings County. A total of 7,923 acre-feet was delivered to WWD in 1999 under this agreement. The letter agreement is expected to be executed in January 2000.

Kern County Water Agency. A letter agreement executed September 13, 1999, among KCWA, TLBWSD, and the Department, approved the transfer of up to 400 acre-feet of KCWA's 1999 SWP entitlement water to TLBWSD. The water was transferred from LHWD, a member unit of KCWA, to Westlake Farms located within the service area of TLBWSD. The transferred water was used to create wetland habitat for shore birds as required under a mitigation agreement between the Regional Water Quality Control Board and LHWD for the operation of LHWD's evaporation basin. A total of 400 acre-feet was transferred. Similar transfers were approved by the Department in 1996, 1997, and 1998.

Metropolitan Water District of Southern California. A letter agreement dated September 3, 1999, between MWD and the Department approved the delivery of up to 35,000 acre-feet of MWD's 1999 SWP entitlement water to WWD in exchange for an equivalent amount of eastside San Joaquin Valley water obtained by WWD. The eastside San Joaquin Valley water will be conveyed to the Arvin-Edison groundwater storage basin as part of the Arvin-Edison/Metropolitan Water Management Program. The letter agreement is expected to be executed in January 2000. During 1999, a total of 33,000 acre-feet was delivered to WWD pursuant to this agreement.

San Bernardino Valley Municipal Water District. A letter agreement executed March 29, 1999, between SBVMWD and the Department allowed SBVMWD to introduce and store up to 9,000 acre-feet of local water from the Santa Ana River and Mill

Creek in Devil Canyon afterbays during 1999. The local water could also be exchanged for water in San Luis Reservoir for later delivery to SBVMWD or rediverted through the San Gabriel pipeline to SBVMWD facilities served from the SBVMWD pipeline. No local water was introduced into SWP facilities under this agreement in 1999.

Santa Clara Valley Water District. An agreement, among SCVWD, KCWA, and the Department, provided for the delivery of a portion of SCVWD's 1999 SWP entitlement water, Article 21 water, and other water supplies, to be stored in and later recovered from groundwater basins within KCWA, in accordance with the Santa Clara and Semitropic Water Storage District Banking Program Agreement. The stored water is to be returned to SCVWD by 2035. This was in accordance with the provisions of the Monterey Agreement that encourage operational flexibility for the SWP, such as groundwater storage of SWP water outside a contractor's service area for later use within the service area. The Department approved similar agreements in 1996, 1997, and 1998. In 1999, a total of 14,520 acre-feet of entitlement water and 15,480 acre-feet of Article 21 water was delivered to SWSD pursuant to this agreement. The agreement is expected to be executed in March 2000.

Solano County Water Agency. A letter agreement, executed July 9, 1999, among the Department, SCWA, and Mojave Water Agency, approved the exchange of up to 3,000 acre-feet of SCWA's 1999 SWP entitlement water to MWA for the return of up to 1,500 acre-feet of MWA's future SWP entitlement water or other future water supply as mutually agreed to by MWA and SCWA and approved by the Department. The water is to be returned by December 31, 2009, during a dry year. A similar agreement was executed in 1997 and 1998. The full 3,000 acre-feet was delivered to MWA in 1999.

Tulare Lake Basin Water Storage District. A letter agreement, dated March 11, 1999, and executed March 29, 1999, between the Department and TLBWSD approved the transfer of up to 3,000 acre-feet of TLBWSD's 1999 SWP entitlement water to WWD. The agreement facilitated the water transfer from Hansen Ranches, a landowner in TLBWSD, to

lands farmed in WWD under the name of Vista Verde Farms, Incorporated. The actual amount transferred was 3,000 acre-feet. The Department approved similar transfers in 1996, 1997, and 1998.

Tulare Lake Basin Water Storage District. A letter agreement between the Department and TLBWSD approved the exchange of up to 13,770 acre-feet of 1999 SWP entitlement water from TLBWSD to WWD. WWD will return an equivalent quantity of local surface water to TLBWSD by December 31, 2009. TLBWSD's SWP water was delivered to land within WWD's service area in both Kings County and Fresno County. The amount of 1999 entitlement water delivered to WWD pursuant to this agreement was 13,770 acre-feet. The letter agreement is expected to be executed in February 2000.

During 1999, water was delivered pursuant to agreements with long-term contractors executed prior to 1999 as described below.

Alameda County Flood Control and Water Conservation District-Zone 7. An agreement dated July 28, 1995, among Byron-Bethany Irrigation District, ACFCWCD-Zone 7, and the Department provides for the transfer of up to 5,000 acre-feet of BBID's local water annually to ACFCWCD-Zone 7 through SWP facilities. BBID may only transfer real water that has been made available for transfer by conservation and fallowing. In 1999, 2,000 acre-feet of BBID's local water was pumped at Banks Pumping Plant and delivered to ACFCWCD-Zone 7's turnouts in the South Bay Aqueduct.

Antelope Valley-East Kern Water Agency. An agreement dated November 13, 1997, between AVEK, MWA, and the Department provided for a change in the delivery of up to 2,250 acre-feet of MWA's SWP entitlement water annually to AVEK's turnout. The agreement allowed for the delivery of MWA's SWP entitlement water to a solar energy generating station within its service area that was not located near any of its conveyance facilities. AVEK had delivery capability and agreed to provide service. During 1999, the Department delivered 1,439 acre-feet of Mojave's 1999 SWP entitlement water to AVEK's turnouts.

Dudley Ridge Water District. An agreement dated May 22, 1998, among DRWD, TLBWSD, and the Department provided for a change in the delivery of up to 1,000 acre-feet of DRWD's SWP entitlement water annually to TLBWSD's turnout. The agreement allowed for the delivery of DRWD's SWP entitlement water to landowners within its service area that were not located near any of its conveyance facilities. TLBWSD's conveyance facilities bifurcate DRWD's service area and have conveyance capability to deliver water to the subject landowner. During 1999, the Department delivered 86 acre-feet of DRWD's 1999 SWP entitlement water to TLBWSD's turnouts.

Kern County Water Agency. A letter agreement among the Department, KCWA, and TLBWSD, dated December 30, 1998, approved the delivery of KCWA's 1998 SWP entitlement water to TLBWSD and the exchange of up to 20,000 acre-feet of TLBWSD's 1999 SWP entitlement water with WWD. An exchange to facilitate the purchase of banked CVP Section 215 water and floodwater from the Friant-Kern Canal by Harris Ranch, a WWD landowner, was executed August 31, 1998. Up to 20,000 acre-feet of KCWA's entitlement water would be exchanged for the banked water. Due to lower than anticipated water demands, Harris Ranch delayed the delivery of exchange water and made arrangements with a water user in TLBWSD to take delivery of up to 20,000 acre-feet of KCWA's entitlement water by December 31, 1998. To complete the originally approved exchange, up to 20,000 acre-feet of TLBWSD's 1999 entitlement water would be delivered to WWD during March 1 to July 15, 1999, for Harris Ranch. The exchange was completed when 20,000 acre-feet of TLBWSD's water was delivered to WWD in 1999.

Metropolitan Water District of Southern California. A letter agreement dated April 13, 1999, approving a second amendment to the interim December 29, 1997, letter agreement among the Department, MWD, KCWA, and Arvin-Edison Water Storage District, extended the term of the letter agreement to June 30, 1999, and allowed the additional delivery of up to 50,000 acre-feet of MWD's 1999 SWP entitlement and Article 21 water to AEWS for storage. The 1997 letter agreement allowed for the delivery of up to 20,000 acre-feet of MWD's 1997

entitlement water to groundwater storage by February 28, 1998. The September 17, 1998, amendment extended the term through December 20, 1998, and allowed for an additional delivery of up to 62,205 acre-feet of 1998 entitlement water to groundwater storage. A total of 50,406 acre-feet of MWD's 1999 entitlement was delivered to AEWS under this agreement. An additional 11,756 acre-feet of MWD's 1999 entitlement water was delivered to AEWS from July through December 1999. The agreement for this additional water is pending.

Metropolitan Water District of Southern California. A letter agreement dated August 21, 1995, between the Department, MWD, and KCWA, approved the delivery of MWD's SWP entitlement and other water supplies for storage and later recovery to the Semitropic Water Storage District groundwater basin. This was in accordance with the provisions of the Monterey Agreement that encourage operational flexibility for the SWP, such as groundwater storage of SWP water outside a contractor's service area for later use within the service area. During 1999, the Department delivered 53,010 acre-feet of MWD's 1999 SWP entitlement and 22,840 acre-feet of Article 21 water for storage in SWSD.

Turnout Agreements

Kern County Water Agency and Arvin-Edison Water Storage District. An agreement dated January 26, 1999, among the Department, KCWA, and AEWS, allowed the construction, operation, and maintenance of the Arvin-Edison Turnout, located at milepost 277.3, Reach 14C of the California Aqueduct. The turnout has a design capacity of 200 cfs.

Kern County Water Agency and Kern Water Bank Authority. An agreement dated November 12, 1999, among the Department, KCWA, and Kern Water Bank Authority, allowed the construction, operation, and maintenance of the 95th Street East Turnout, located at milepost 237.19, Reach 12E of the California Aqueduct. The turnout has a design capacity of 750 cfs.

Antelope Valley-East Kern Water Agency. On November 23, 1999, the Department approved the construction of the Rancho Vista Turnout for

AVEKWA located at milepost 339.68, Reach 20B on the East Branch of the California Aqueduct. The turnout has a design capacity of 5 cfs.

Agreements Related to the Monterey Amendments

Turnback Water Pool Program. Under Article 56(d) of the Monterey Amendments, the fourth year of the Turnback Water Pool Program was initiated through Notice to the State Water Project Contractors No. 99-01, dated January 22, 1999. All SWP contractors who signed Monterey Amendments were permitted to participate in the program. The program allowed SWP contractors to offer a portion of their approved 1999 entitlement for sale in a turnback pool for use outside their service area. Other contractors interested in purchasing this water could then request a portion or all of it. Based on supply and demand, the turnback water was allocated among the selling and purchasing contractors. In 1999, 237,904 acre-feet of water were purchased under the Turnback Water Pool Program.

Transactions for Pool A occurred in January and February 1999; transactions for Pool B occurred in March 1999. Turnback water sold for \$11.79 per acre-foot, 50 percent of the Delta Water Rate through Pool A, and for \$5.90 per acre-foot, 25 percent of the Delta Water Rate through Pool B. All money collected through the Turnback Water Pool Program was paid to the selling contractors. The 1999 Turnback Water Pool Program closed April 1, 1999.

The following contractors participated in Pool A of the Turnback Water Pool Program:

- County of Butte sold 934 acre-feet
- City of Yuba City sold 4,260 acre-feet
- SLOCFCWCD sold 11,331 acre-feet
- SBCFCWCD sold 4,587 acre-feet
- AVEKWA sold 8,122 acre-feet
- CLWA sold 4,000 acre-feet
- Crestline-Lake Arrowhead Water Agency sold 1,530 acre-feet
- Mojave Water Agency sold 5,000 acre-feet
- SBVMWD sold 41,560 acre-feet
- DRWD purchased 6,000 acre-feet
- KCWA purchased 24,060 acre-feet
- TLBWSD purchased 51,264 acre-feet

The following contractors participated in Pool B of the Turnback Water Pool Program:

- County of Butte sold 1,156 acre-feet
- City of Yuba City sold 3,840 acre-feet
- NCFWCWCD sold 4,650 acre-feet
- SLOCFCWCD sold 9,730 acre-feet
- SBCFCWCD sold 9,484 acre-feet
- AVEKWA sold 55,360 acre-feet
- CLWA sold 18,200 acre-feet
- CLAWA sold 2,320 acre-feet
- SBVMWD sold 41,040 acre-feet
- SGVMWD sold 10,800 acre-feet
- DRWD purchased 2,000 acre-feet
- KCWA purchased 21,300 acre-feet
- TLBWSD purchased 85,900 acre-feet
- CVWD purchased 27,380 acre-feet
- DWA purchased 20,000 acre-feet

Other Administrative Action

Santa Barbara County Flood Control and Water Conservation District and Water Agency. A letter dated August 13, 1999, from the Department to SBCFCWCD approved the extension of the deadline for reacquisition of all or a portion of the 12,214 acre-feet of previously established relinquished SWP entitlement until July 1, 2000. The original deadline of March 12, 1998, previously established by the Department, had been extended several times. SBCFCWCD did not take delivery of any reacquired water in 1999.

Miscellaneous Agreements with Other Agencies

In addition to negotiating agreements with SWP contractors to provide for specified water deliveries, the Department also entered into several agreements with other agencies for water conveyance, or exchange, between January 1, 1999, and December 31, 1999.

Water Conveyance Agreements—CVP Water

The Department regularly enters into agreements to convey CVP water, such as agreements with contractors receiving water from USBR through the Cross Valley Canal, a water conveyance facility that connects with the Aqueduct near Tupman in Kern

County. Other agencies or corporations receive CVP water through agreements between the Department and USBR, including the U.S. Department of Veterans Affairs, U.S. Fish and Wildlife Service, and Musco Olive Products, Inc. Occasionally, the Department also enters into agreements with USBR to convey CVP or SWP water from the Delta to O'Neill Forebay through CVP or SWP facilities. Some of these agreements allow USBR to make up for curtailed water exports from Tracy Pumping Plant associated with improving conditions for fish in the Delta. Other agreements allow replacing water exports foregone during maintenance and repair of Tracy and Banks Pumping Plants and CVP and SWP conveyance facilities between the Delta and O'Neill Forebay.

Cross Valley Canal. The CVC is used by eight CVP water contractors to obtain water from the California Aqueduct either by exchange with other agencies or, by direct delivery. The eight water contractors are: County of Fresno, County of Tulare, Hill's Valley Irrigation District, Kern-Tulare Water District, Lower Tule River Irrigation District, Pixley Irrigation District, Rag Gulch Water District, and Tri-Valley Water District. These agencies have had uninterrupted water conveyance service by the Department since 1975-76 through

- individual 3-party contracts with the Department and USBR, executed in 1975 and 1976 with individual amendments to those contracts, signed on December 28, 1995; and,
- 2-year interim renewal contracts for the term March 1, 1996, through February 28, 1998, and further renewed on March 1, 1998, through February 29, 2000.

Between January 1, 1999, and December 31, 1999, the Department executed agreements with CVC contractors as follows:

- On May 10, 1999, LTRID and PID requested the Department change the point of delivery for their full 1999 CVP entitlement water from the CVC turnout to turnouts in reaches 4 through 7 of the California Aqueduct for delivery to WWD. The Department and the two districts executed individual agreements on December 21, 1999, for Department conveyance

of up to 31,102 acre-feet of water for each district, of which 6,340 acre-feet for LTRID and 3,446 acre-feet for PID were delivered to WWD.

- On April 29, 1999, May 18, 1999, and August 5, 1999, Kern-Tulare Water District requested the Department change the point of delivery for up to 28,000 acre-feet of their 1999 CVP entitlement water from the CVC turnout to turnouts in reaches 4 through 7 of the California Aqueduct for delivery to WWD. The Department and the district executed an agreement on December 21, 1999, for Department conveyance of up to 28,000 acre-feet of water for the district, of which 5,955 acre-feet was delivered to WWD.
- On April 29, 1999, May 18, 1999, and August 5, 1999, Rag-Gulch Water District requested the Department change the point of delivery for up to 9,310 acre-feet of their 1999 CVP entitlement water from the CVC turnout to turnouts in reaches 4 through 7 of the California Aqueduct for delivery to WWD. The Department and the district executed an agreement on December 21, 1999, for Department conveyance of up to 9,310 acre-feet of water for the district, of which 3,634 acre-feet was delivered to WWD.

Friant Water Users Authority. An agreement dated September 24, 1999, between the Department and Friant Water Users Authority asked the Department to convey up to 25,000 acre-feet of CVP water from the San Luis Canal at Kettleman City to the CVC turnout at Tupman. The water was identified as “Exchange Water” in a July 6, 1999, letter agreement between the Friant Water Users Authority, various CVP Friant water service contractors, and USBR. This water was to be conveyed from July 1, 1999, through February 29, 2000. In 1999, a total of 12,804 acre-feet was delivered.

Musco Olive Products, Inc. An annual agreement dated September 16, 1999, between the Department and USBR provided for the conveyance of up to 400 acre-feet of CVP water to Reach 2A of the California Aqueduct for use by Musco Olive Products, Inc. This water was to be conveyed from January 1, 1999, through September 30, 1999. A total of 360 acre-feet was delivered.

Tracy Golf and Country Club. An agreement dated April 28, 1999, among the Department, USBR, and

Tracy Golf and Country Club, provided for the conveyance of up to 1,240 acre-feet of CVP water through SWP facilities to the Tracy Golf and Country Club. This water was to be conveyed from March 1, 1999, through February 29, 2000. A total of 204 acre-feet was delivered in 1999.

U.S. Department of Veterans Affairs. An annual agreement, dated February 24, 1999, and replaced July 27, 1999, between the Department and USBR approved the conveyance of up to 450 acre-feet of CVP water to Reach 2B of the California Aqueduct for use by the U.S. Department of Veterans Affairs at the San Joaquin Valley National Cemetery. The water was to be conveyed from January 1, 1999, through September 30, 1999. A total of 43 acre-feet was delivered.

U.S. Fish and Wildlife Service Cooperative Agreement. USBR initiated a cooperative agreement with the Department to deliver CVP water to the Kern National Wildlife Refuge for USFWS. Under the terms of this cooperative agreement, dated September 9, 1994, up to 26,530 acre-feet of CVP water would be delivered from Check 21 to the Buena Vista Water Storage District Turnout BV-1B, on Reach 10A of the California Aqueduct, from October 1, 1993, through April 10, 1995. Since the cooperative agreement was signed, eight modifications to the agreement have been executed. Under Modification No. 001, dated October 31, 1994, additional funding was provided. Modifications were made each year to the agreement. Modification No. 007, executed August 17, 1999, extended the agreement through April 10, 2000, and defined the water delivery rates for 2000. Modification No. 008, dated November 29, 1999, obligated funding for that period. The Department conveyed 10,476 acre-feet for USBR to the Kern National Wildlife Refuge in 1999.

U.S. Bureau of Reclamation. A letter agreement dated August 18, 1999, between the Department and USBR had the Department exporting 16,281 acre-feet of CVP water from the Sacramento-San Joaquin Delta from February 24 through 27, 1999. The CVP water transported to O’Neill Forebay replaced exports foregone at the Tracy Pumping Plant in January due to fishery protection measures pursuant to

Anadromous Fish Restoration Program Action No. 8 implemented by USBR under provisions of CVPIA.

Other Agreements–Turnouts

In 1999, there were no new turnout agreements with any miscellaneous agencies.

Amendments to Miscellaneous Agreements with Other Agencies

An amendment, dated April 19, 1999, modified and clarified provisions of the existing contract between the Department and ECCID dated January 7, 1981, and the contract among the Department, ECCID, and CCWD, dated April 11, 1991, to allow the diversion of water under both contracts at the Contra Costa Canal intake and the Los Vaqueros Project intake and to increase the allowable rate of diversion at those locations. The Amendment also defined the allowable place of use and allowed the use of water outside ECCID boundaries only with the prior written consent of the Department. The Amendment is expected to be executed in February 2000.

Water Deliveries

Water Allocations

Each year, by October 1, the SWP long-term water contractors submit initial requests for water deliveries for the subsequent calendar year. Initial entitlement allocations for the coming year are made by the Department in December and are based on operations studies that assume 90 percent exceedence of historic water supply, current reservoir storage, and total requests by the SWP water contractors. Forecasts for the year are updated as the hydrological conditions change. Allocations are increased or decreased depending on both actual and projected hydrologic conditions. Unless otherwise warranted, the final May 1 water supply forecast sets delivery allocations for the remainder of the year.

On October 1, 1998, SWP long-term contractors submitted initial requests for 1999 entitlement deliveries totaling 3.42 million acre-feet. The Department approved deliveries of 2.24 million acre-feet on November 24, 1998, resulting in an initial entitlement allocation for 1999 of 55 percent. Improved water conditions increased the 1999 allocation of

entitlement water to 2.44 million acre-feet or 60 percent on February 10, 1999. As a result of additional improvements in water conditions and a reduction in SWP contractor requests to 3.19 million acre-feet, allocations were further increased to 100 percent on March 10, 1999, and remained at that level for the rest of 1999.

SWP Deliveries

The SWP delivers water for a variety of beneficial uses. In addition to delivering entitlement water to long-term water supply contractors, the SWP

- conveys water to, and stores water for, other public agencies through special contracts and agreements;
- provides water for wildlife and recreational uses; and
- stores, releases, and delivers local runoff water from SWP facilities to agencies that hold local water rights.

In 1999, 4,095,269 acre-feet of water were conveyed to 27 long-term contractors and 17 other agencies. That amount includes

- 2,738,891 acre-feet of entitlement water¹, (with 2,391,985 acre-feet delivered to long-term contractors' service areas, 130,969 acre-feet to WWD, and 215, 937 acre-feet delivered under the Turnback Water Pool Program);
- 158,070 acre-feet of Article 21 water; (see page 114 for more information.)
- 4,324 acre-feet of SWP water for recreation, fish and wildlife; and
- 1,193,984 acre-feet of water delivered to satisfy water rights settlement agreements and agreements made with SWP contractors and other agencies, including USBR.

Figure 9-1 shows amounts of water delivered to various locations during 1999.

¹ Annual entitlement water is the amount of SWP water long-term contractors may request each year in accordance with Article 12(a), "Procedure for Determining Water Delivery Schedule," of their water supply contract.

Specific information about water deliveries made to long-term contractors and other agencies during 1999 and historical deliveries from 1962 through 1999 are presented in the following three sections, each with a corresponding table:

- Water Delivered to Long-Term Water Supply Contractors in 1999, by Service Area (Table 9-2);
- Water Delivered in 1999, by Month (Table 9-3); and
- Total Amounts of Annual Water Entitlements and Water Conveyed, by Type, 1962-99 (Table 9-4).

Water Deliveries and Credits to Long-Term SWP Contractors

Table 9-2 shows amounts of water delivered in 1999 and future entitlement credits granted to long-term contractors through 1999. The following information about specific columns in Table 9-2 is arranged by column number.

1999 Entitlement Water Delivered. Columns 1 through 5 show a detailed breakdown of entitlement water delivered to long-term water supply contractors in 1999.

Turnback Pool Water. Column 4 shows 215,937 acre-feet of turnback pool water was delivered to long-term water supply contractors in 1999.

1998 Carryover Entitlement Water Delivered During 1999. In some instances, with the Department's approval, contractors may delay delivery of entitlement water to the next year (also known as carryover entitlement water). Column 6 shows no entitlement water was carried over from 1998 for delivery in 1999.

Article 12(d) Water. Column 7 shows no Article 12(d) water was delivered in 1999.

Article 14(b) Water. No 1998 entitlement water was delivered in 1999 under Article 14(b).

Total Entitlement Water Delivered. Column 9 shows all entitlement water delivered in 1999—a total of 2,738,891 acre-feet.

1999 Article 21 Water. Column 10 shows 158,070 acre-feet of 1999 Article 21 water delivered to long-term water supply contractors in 1999. Article 21 water is water in excess of that required to meet all demands for entitlement water and water to be stored in SWP reservoirs. Article 21 was amended most recently by the Monterey Amendment. Long-term water supply contractors who signed their Monterey Amendment receive interruptible water under Article 21. Long-term water supply contractors who have not signed the Monterey Amendment receive surplus and unscheduled water.

Total SWP Water Delivered. Column 11 shows 2,896,961 acre-feet of total SWP water delivered in 1999. This includes total entitlement water and Article 21 water.

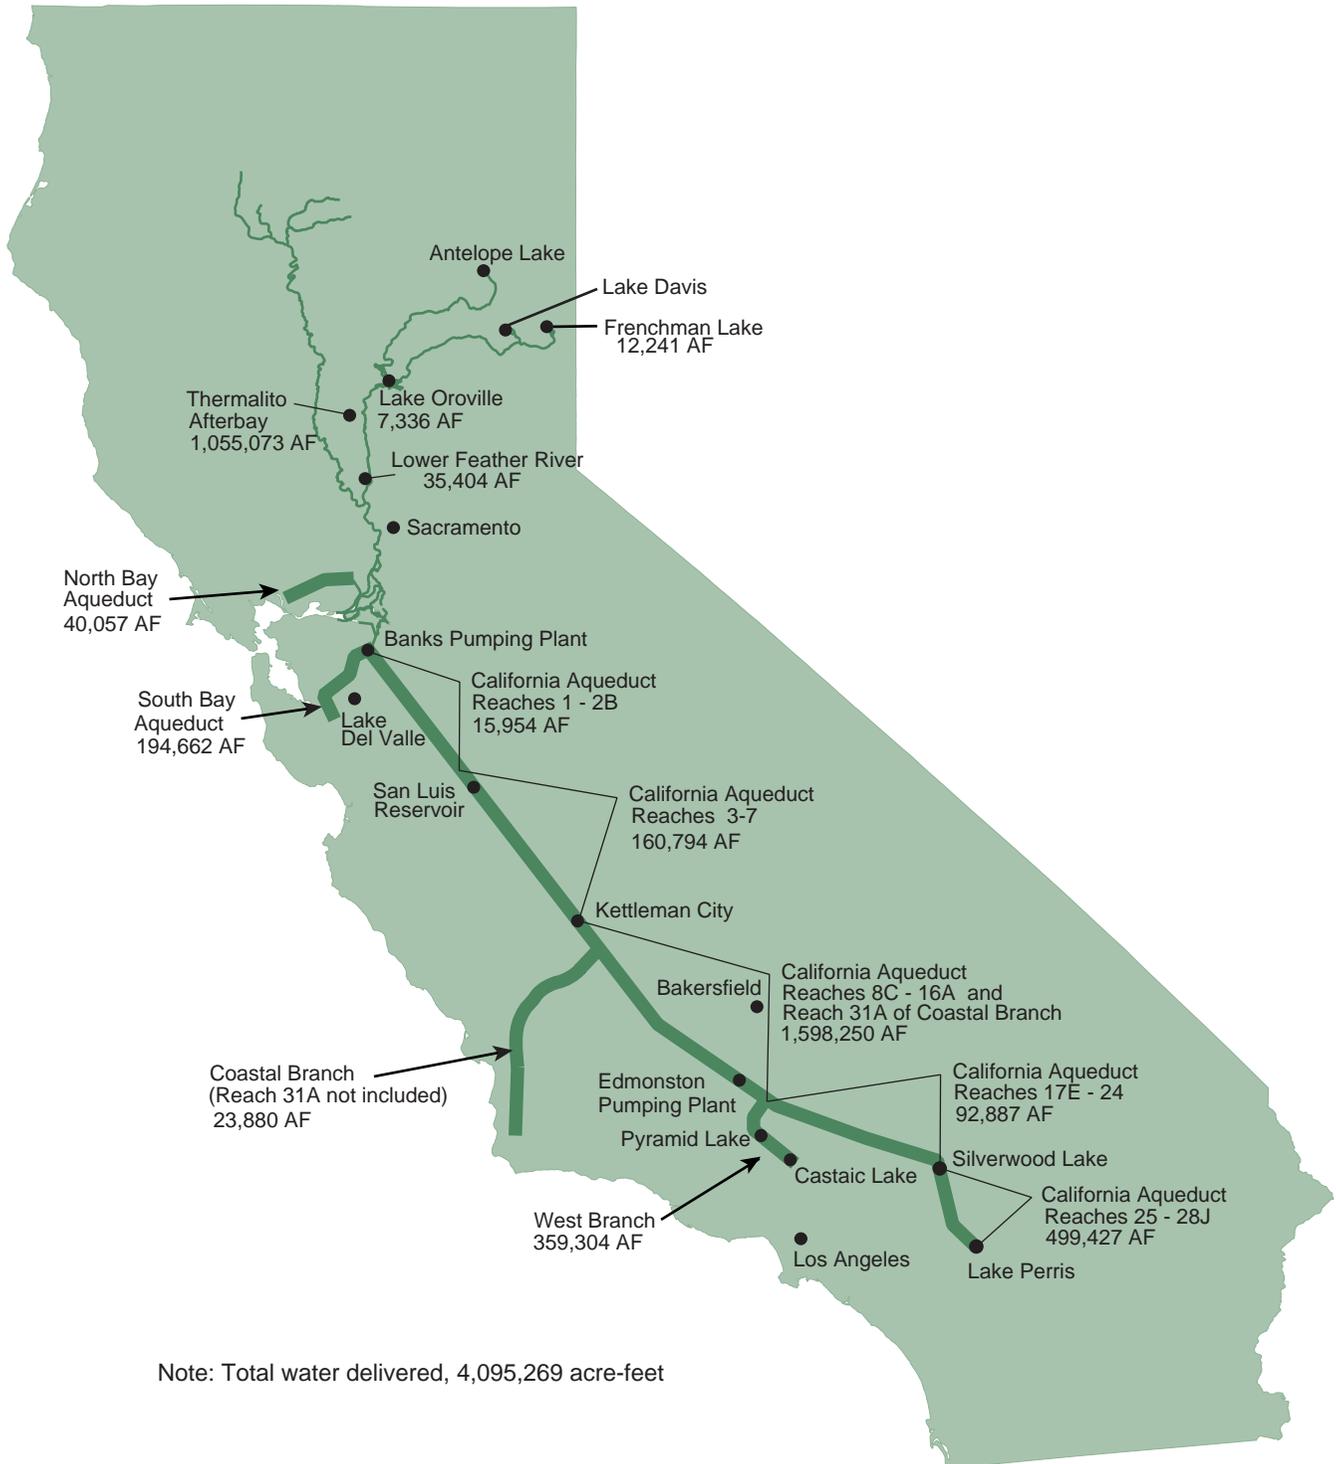

Non-SWP Water Deliveries. Column 12 includes deliveries of nonproject water to long-term water contractors. Nonproject water is generally local water that a SWP contractor has a water right to, or water purchased from or exchanged with non-SWP agencies. In 1999, other water deliveries totaled 25,029 acre-feet.

Total Deliveries. Column 13 shows total amounts of water delivered to long-term contractors. In 1999, the SWP delivered 2,921,990 acre-feet to 27 long-term contractors. This amount included 2,738,891 acre-feet of entitlement water, 158,070 acre-feet of Article 21 water, and 25,029 acre-feet of nonproject water.

Carryover Water Approved for Delivery. For several years, the Department has offered contractors the opportunity to carry over a portion of their entitlement water approved for delivery in the current year for delivery during the next year. The carryover program was designed to encourage the most effective and beneficial use of water and to avoid obligating the contractors to use or lose the water by December 31 of each year. The SWP contractors' long-term contracts and amendments state the criteria of carrying over entitlement water from 1 year to the next.

In 1999, 303,966 acre-feet of carryover water were approved for future delivery. In addition, 14,956 acre-feet of 14(b) carryover were approved

^a Includes deliveries to short-term contractors (Mustang Water District, 1970-1972; Tracy Golf and Country Club, 1974, 1979, and 1980; Green Valley Water District, 1974, 1975, 1978, 1979, 1980, and 1985; Granite Construction Company, 1980). Surplus, extra surplus, unscheduled, and interruptible water are included.

^b Includes water conveyed for SWP and non-SWP water contractors.

^c Includes water diverted under various water rights agreements.

^d Amounts reflect net effect of (1) operational losses from SWP transportation facilities; (2) changes in reservoir storage south of Delta; (3) storable local inflows to SWP reservoirs; (4) side inflow to San Luis Canal; and (5) inflow into California Aqueduct from Kern River Intertie.

for delivery in 2000 due to maintenance and repair of the Aqueduct, which prevented delivery of this water to two contractors in 1999.

Water Delivered in 1999, by Month

During 1999, the SWP provided water service to 42 agencies, including 27 long-term water contractors. Those agencies and the amounts of water delivered to them by month are listed in Table 9-3.

This section and the accompanying table summarize water deliveries for 1999. Information about those deliveries is categorized as SWP water and non-project water.

State Water Project Water

SWP water is classified into the following categories:

Long-term water supply contracts

- current year entitlement
- Article 21
- transfer and exchange entitlement
- carryover entitlement
- stored
- turnback pools A and B entitlement

Recreation and fish and wildlife water

- enhancement
- mitigation

Operational flood release water

- operational flood release

The SWP may approve exchanges and transfers of entitlement water among various contractors if certain conditions are met.

In 1999, SWP water was delivered in the following classifications and amounts.

Entitlement Water. A total of 2,738,891 acre-feet of 1999 entitlement water was delivered to 27 long-term contractors.

Article 21 Water. A total of 158,070 acre-feet of Article 21 water was delivered in 1999.

Transfers and Exchanges of Entitlement Water. During 1999, a total of 144,894 acre-feet of entitle-

ment water was transferred to or exchanged between SWP long-term contractors and non-SWP water agencies as follows:

- DRWD transferred to TLBWSD, 86 acre-feet
- KCWA exchanged with WWD, 20,423 acre-feet
- KCWA transferred to WWD, 40,776 acre-feet
- KCWA exchanged with TLBWSD, 9,000 acre-feet
- KCWA transferred to TLBWSD, 400 acre-feet
- TLBWSD transferred to WWD, 16,770 acre-feet
- TLBWSD exchanged with WWD, 20,000 acre-feet
- MWA transferred to AVEKWA, 1,439 acre-feet
- MWD exchanged with WWD, 33,000 acre-feet
- SCWA exchanged with MWA, 3,000 acre-feet

Other Exchanges of Entitlement Water. In 1999, nonproject water was exchanged for project water as follows.

U.S. Bureau of Reclamation. A water exchange between USBR and the Department was approved June 23, 1999. From July 1 through November 24, 1999, approximately 54 acre-feet were moved from the Sacramento River at the Colusa Bypass for an equivalent amount of SWP water from Lake Oroville. The exchange was made under the *Agreement between the United States of America and the Department of Water Resources of the State of California for Coordinated Operation of the Central Valley Project and the State Water Project*, dated November 24, 1986.

Carryover Entitlement Water. There was no 1998 entitlement water carried in SWP storage facilities for delivery in 1999.

Article 21 Water. The Article 21 water program allows a contractor to take delivery of water over the approved and scheduled allocations for the current year (for more information about Article 21 water, see page 114). Article 21 water is available for delivery on a short-term basis as determined by the Department when scheduled project demands are being delivered and operational requirements for project water deliveries, water quality, and other requirements are being met.

- In 1999, eight contractors participated in the program. A total of 158,070 acre-feet of Article 21 water was delivered to NCFCWCD, EWSID, ACFCWCD-Zone 7, ACWD, SCVWD, DRWD, KCWA, TLBWS, and MWD.

Water for Recreation and Fish and Wildlife. A total of 4,324 acre-feet of SWP water was conveyed for recreational use and enhancement of fish and wildlife.

Recreational Use. The SWP delivered 629 acre-feet of water for facilities at Lake Oroville, Lake Del Valle, O'Neill Forebay, Silverwood Lake, and Lake Perris. In addition, 2,865 acre-feet were delivered to Castaic Lake and Castaic Lagoon, an impoundment downstream from Castaic Lake devoted entirely to recreation.

Trout Fishery. The SWP released 18 acre-feet of water to maintain a trout fishery in Piru Creek as a condition of obtaining a license from the Federal Energy Regulatory Commission to develop a power plant at Pyramid Lake.

Wildlife Management. The SWP delivered 812 acre-feet of water to use in managing wildlife in the Pilibos Wildlife Area, located on about 770 acres of land near O'Neill Forebay, 40 miles south of Los Banos.

Operational Flood Release Water

There was no operational flood water released in 1999.

Non-State Water Project Water

In 1999, the Department used SWP facilities to convey non-SWP water for various agencies according to the terms of water rights and water transfer and exchange agreements. Detailed information concerning those conveyances follows.

Alameda County Flood Control and Water

Conservation District-Zone 7. Under a contract executed July 28, 1995, between the Department and ACFCWCD-Zone 7, the Department conveyed 2,000 acre-feet of non-SWP water for ACFCWCD-Zone 7 during 1999. The Department conveyed this water from August through October

directly from the Delta to Reach 6 of the South Bay Aqueduct. ACFCWCD-Zone 7 purchased the rights to transfer this water from BBID under a separate contract.

Central Valley Project Water. In 1999, the Department conveyed 60,283 acre-feet of CVP water through SWP facilities. Conveyance was made in accordance with agreements negotiated with USBR and contractors receiving water from USBR through the CVP as follows.

Cross Valley Canal Contractors. Under four individual agreements between the Department and LTRID, PID, RGWD, and KTWD dated December 21, 1999, the Department conveyed 6,340, 3,446, 3,634, and 5,955 acre-feet of CVP water for each district to WWD's turnouts in Reach 4 and Reach 5 of the California Aqueduct, respectively.

Friant Water Users Authority. Under an agreement dated September 24, 1999, the Department conveyed 12,804 acre-feet of CVP water from the San Luis Canal at Kettleman City to the CVC turnout at Tupman. The water was identified as exchange water. Conveyance will continue into 2000.

Musco Olive Products, Incorporated. In accordance with terms of a conveyance agreement with USBR, dated September 16, 1999, the Department conveyed 360 acre-feet of CVP water to Reach 2A of the California Aqueduct for Musco Olive Products, Inc.

Recreational and Wildlife Use. In 1999, the Department conveyed 740 acre-feet of CVP water to DFG at O'Neill Forebay and WWD's Lateral 4L within Reach 5 of the joint-use facilities of the California Aqueduct.

Tracy Golf and Country Club. Under an agreement with the Tracy Golf and Country Club, the Department conveyed 204 acre-feet of CVP water to the course for irrigation purposes. The agreement is expected to be executed in August 2000.

U.S. Bureau of Reclamation. Under an agreement, dated August 18, 1999, the Department conveyed 16,281 acre-feet of CVP water through the California Aqueduct to O'Neill Forebay to replace exports

forgone at the Tracy Pumping Plant in January due to fishery protections measures pursuant to Anadromous Fish Restoration Program Action No. 8.

U.S. Department of Veterans Affairs. Under an annual agreement with USBR, dated February 24, 1999, the Department conveyed 43 acre-feet through SWP facilities to maintain the San Joaquin Valley National Cemetery near Santa Nella, California. The Department conveyed this water to Reach 2B of the California Aqueduct.

U.S. Fish and Wildlife Service. The Department conveyed 10,476 acre-feet of CVP water for USFWS according to provisions of an amended cooperative agreement initiated by USBR dated September 9, 1994. The water was conveyed to the Kern National Wildlife Refuge through Reach 10A of the California Aqueduct.

Floodwater. Occasionally, during wet years, the Department accepts floodwater from the Kern River into the California Aqueduct through the Kern River-California Aqueduct Intertie under an *Agreement among the State of California, Kern County Water Agency, and the Kern River Interests for Diversions of Floodwaters through the Kern River-California Aqueduct Intertie*, dated November 18, 1975. In 1999, the Department did not accept any floodwater into the California Aqueduct.

Water Rights Water. Water in this category is transported through SWP facilities to long-term SWP contractors and other agencies according to terms of various local water rights agreements. Some water simply passes through SWP transportation facilities; a portion is stored in SWP reservoirs for release at a later time. In 1999, 1,131,701 acre-feet of water in this category were delivered to the Feather River, South Bay, and Southern California areas.

Feather River Area. Nine nonproject agencies in the Feather River area received 1,108,672 acre-feet. Those agencies are

- Last Chance Creek Water District, 12,241 acre-feet
- Thermalito Irrigation District, 2,567 acre-feet
- Oroville-Wyandotte Irrigation District, 7,336 acre-feet

- Western Canal Water District, 326,611 acre-feet
- Joint Water District Board, 725,609 acre-feet
- Tudor Mutual Water Company, 4,572 acre-feet
- Oswald Water District, 1,722 acre-feet
- Garden Highway Water Company, 16,809 acre-feet
- Plumas Mutual Water Company, 11,205 acre-feet

South Bay Area. In the South Bay area, 23,016 acre-feet of local water were delivered to ACFCWCD-Zone 7 and ACWD. These two South Bay Aqueduct contractors hold water rights to runoff from the Lake Del Valle watershed.

Southern California. In Southern California, 13 acre-feet of local runoff from the Houston Creek watershed were stored and delivered to CLAWA under local water rights. These local water rights have been signed over to the Department as part of the contractual arrangements for storing and delivering this local runoff for CLAWA.

Annual Water Entitlements and Water Delivered Since 1962

Information about annual water entitlements and water conveyed for the past 38 years is contained in Table 9-4. The following discussion of entitlements and water conveyed is arranged according to column numbers.

Annual Entitlements. Columns 1 through 7 of Table 9-4 show the amount of the long-term contractor's entitlement water by area for years 1962 through 1999 as specified in the entitlement schedules (Table A, Annual Entitlements) of the long-term water supply contracts.

In some instances these entitlement schedules—projections of each contractor's need for water to 2035—have been amended to meet the needs of individual contractors. The amounts of entitlement water each contractor may request for years 1962 through 2035 may be found in Table B-4, Annual Entitlements to Project Water, in Appendix B.

Water Delivered. Columns 8 through 17 show water delivered or conveyed, including initial fill water and operational losses and storage changes.

Entitlement Water. Column 8 shows amounts of entitlement water delivered each year from 1962 through 1999.

Article 21 Water. Article 21 water is water in excess of that required to meet all demands for entitlement water and water to be stored in SWP reservoirs.

Column 9 shows amounts of Article 21 water, as defined under *SWP Deliveries* (see page 114), delivered from 1962 through 1999.

Column 10 includes amounts of water classified as other water delivered in 1999, including nonproject water conveyed through SWP facilities and regulated delivery of local supply.

In 1999, a total of 85,312 acre-feet of other water was delivered.

Feather River Diversions. Column 12 includes amounts of water from the Feather River delivered according to agreements for water rights water. In 1999, a total of 1,108,672 acre-feet in this category was delivered to agencies in the Feather River area.

Recreation Water. Column 12 shows water conveyed for recreational use or to provide water to improve water quality for fish and wildlife. In 1999, a total of 4,324 acre-feet of SWP water was conveyed for this purpose.

Initial Fill Water. The quantities listed in Column 14 represent the amounts used to initially fill the aqueducts and reservoirs south of the Delta to maximum operating capacities. Initial filling began in 1962 with the filling of the South Bay Aqueduct and was completed in 1979 when Lake Perris reached its maximum operating capacity of 127,000 acre-feet. In 1996 and 1997, the Coastal Aqueduct was initially filled.

Operational Losses. Column 15 includes the total amounts of water lost through evaporation and seepage, net storage changes in reservoirs south of the Delta, and amounts of inflow from local drainage areas, including inflows into San Luis Canal and from the Kern River Intertie.

Negative values are indicated for years when withdrawals and evaporation from reservoirs south of the Delta exceed the amounts of water added to the reservoirs.

Information for this chapter was provided by the State Water Project Analysis Office.

Chapter 10
Power Resources

Scenic overview of Devil Canyon
Power Plant near San Bernardino

Significant Events

- In 1999, the Oroville Relicensing Steering Committee recommended that the Department consider using the Federal Energy Regulatory Commission's Alternative Licensing Procedures, which encourage a collaborative stakeholder approach throughout the multiyear relicensing process.
- In 1999, energy used at the 25 State Water Project pumping and generating plants totaled 5.76 billion kWh.
- In 1999, the Department sold 4.23 billion kWh of energy to 27 utilities and 13 power marketers for total revenues of \$104.15 million. The Department also received \$22.36 million from capacity sales, exchanges, and transmission arrangements. The combined revenue received was \$126.5 million.
- In 1999, the Department became involved in a record number of proceedings and dockets before FERC, as the new California Independent System Operator Corporation and California Power Exchange introduced numerous market modifications in an effort to transition from startup to stable conditions.

Long-term State Water Project contractors depend on the SWP to provide economical sources of power to deliver affordable water. Responding to that need, the Department developed and administers a comprehensive power resources program. Key elements of the program include the strategic timing of generation and pumping schedules, purchase of power resources and transmission services, short-term sales of power surpluses, and studies of power resources for future needs.

Power Resources Program

The goals of the SWP power resources program are to

- obtain reliable, environmentally sensitive, and competitively priced power sources and transmission services sufficient to operate the SWP;
- develop and manage power resources to minimize the cost of water deliveries to SWP contractors;
- minimize impacts on the SWP when major contractual power arrangements begin to expire in 2004;
- meet responsibilities and criteria of the Western Systems Coordinating Council; and
- conform with regulations of the California Energy Commission and the Federal Energy Regulatory Commission.

To achieve these goals, the Department constructed its own power facilities and contracted for long-term power resources with many electric utilities. In addition, the Department arranged for transmission service between SWP power resources and pumping loads and interconnected utilities. The power resources program takes advantage of SWP water storage and conveyance capacities that allow the Department to operate SWP pumps independently of water delivery needs. This control of pumping loads and generation allows the Department to enter into advantageous agreements with other electric utilities that complement the use of SWP generation to meet SWP power requirements.

Reliability Management System

In 1996, electrical disturbances on local transmission networks led to two major outages of the interconnected transmission systems of several states, including California. In both instances, operation of the SWP, as well as that of numerous other major transmission-dependent systems, was adversely impacted.

The 1996 summer outages on the western grid focused attention on the need to take additional steps to ensure the reliability of the western interconnected grid. To address these concerns and ensure reliability, WSCC developed the voluntary Reliability Management System Program and implemented it in September 1999.

The RMS criteria are based on existing WSCC and FERC reliability criteria, and participants are subject to sanctions for noncompliance. Currently there is no legal authority to require any entity to participate in a mandatory reliability program with sanctions.

The Department is not currently an RMS signatory, but voluntarily submits Automatic Voltage Regulator and Power System Stabilizer data to WSCC and is considering signing the RMS agreement.

Oroville Facilities Relicensing

The existing 50-year hydroelectric license for the Oroville facilities will expire January 31, 2007. To obtain a new license, the Department must submit an application to FERC by January 31, 2005. Due to the intense interest in issues examined during relicensing processes, many applicants have found the process to

be very complex and lengthy. As a result, relicensing applicants for large projects typically begin preparatory work 8 to 10 years in advance of the existing license expiration.

In April 1998, the Department formed the Oroville Relicensing Steering Committee to provide guidance to staff involved in relicensing preparations. This committee is composed of managers and supervisors from Department organizations who will participate in the relicensing process. During 1998, the committee provided recommendations on policy issues, consultant roles, FERC licensing procedures, and formation of a Department relicensing team.

In 1999, the Steering Committee recommended that the Department consider using FERC's Alternative Licensing Procedures, which encourage a collaborative stakeholder approach throughout the multiyear relicensing process. FERC offers three relicensing procedures—traditional, hybrid, and alternative—that allow applicants to accommodate their unique interests and operations while seeking a license renewal. The traditional process involves minimal FERC involvement while the alternative procedures allow for more FERC involvement and stakeholder interaction.

Potential Sale of Reid Gardner Unit 4

In early 1998, the Nevada Power Company announced plans to merge with Sierra Pacific Power Company. To enhance prospects for regulatory approval of the merger, NPC announced that both NPC and SPPC would sell all their generating plants if the merger is approved. The Department and NPC are co-owners of Reid Gardner Unit 4, a 275-MW coal power plant. NPC asked the Department to also sell its share. In 1999, the Department considered that request and evaluated the advantages, disadvantages, and the fair market price for the power plant and the allocation of sale proceeds between the Department and NPC.

Restructuring of the Electric Utility Industry

On September 23, 1996, Assembly Bill 1890 was signed into law by the Governor. AB 1890 called for restructuring the electric utility industry in California and creating the California Independent System Operator and the separate California Power

Exchange. To make the new California markets viable and limit market power control of the investor-owned utilities (Pacific Gas and Electric Company, Southern California Edison Company, and San Diego Gas and Electric Company), the utilities were required to unbundle their transmission, generation, and distribution into separate business units and divest half of their thermal generation. The investor-owned utilities were granted full recovery of their stranded costs through a competition transition charge.

On March 31, 1998, ISO and CalPX began operation. ISO manages most of California's transmission grid and is responsible for overall system reliability. Scheduling coordinators were created to submit energy schedules to ISO. All loads and resources within the ISO-controlled grid, and resources imported or exported within California, must schedule through these coordinators. ISO operates the following three markets:

- ancillary services market, which consists of regulation, spinning, nonspinning, replacement reserves, voltage support, and black start. Regulation, spinning, nonspinning, and replacement reserves are acquired through day-ahead and hour-ahead markets. Voltage support and black start are purchased on a yearly contract basis;
- congestion management market, which uses adjustment bids to clear congestion on a transmission path; and
- real-time imbalance market, which uses supplemental energy bids to maintain grid integrity by adjusting generation to match constantly changing loads and system losses.

CalPX schedules the loads and resources to ISO as the scheduling coordinator for the three investor-owned utilities. CalPX also operates the day-ahead market and the hour-ahead market for the purchase and sale of energy by other market participants.

In 1998, the Department signed numerous agreements to participate in ISO and CalPX markets, including the following agreements with ISO: (1) Scheduling Coordinator Agreement, (2) Meter Service Agreement for Scheduling Coordinators, (3) Participating Generator Agreement, and (4) Meter Service Agreement for ISO Metered Entities. The

Department also signed the PX Participation Agreement with CalPX.

The Department continued to participate in various “stakeholder” processes to resolve ongoing issues of concern, both before and after ISO and CalPX startup. Major issues included

- development of ISO’s transmission access charge and off-peak rates;
- conversion of existing transmission contracts to ISO service and receipt of financial and physical transmission rights from ISO as compensation;
- unbundling ISO’s grid management charge paid by scheduling coordinators to recover ISO’s costs;
- reaching conformity between the investor-owned utilities’ transmission owner’s tariffs and ISO’s tariff;
- numerous ISO and CalPX tariff amendments filed with FERC, covering operational issues discovered during ISO and CalPX operations;
- redesign of the ISO’s Ancillary Services markets to increase participation, reduce costs, and provide for proper cost allocation;
- revision of Reliability Must-Run contracts to reduce costs and prevent gaming by owners;
- firm transmission rights auction to purchase firm transmission capacity on congested interzonal and intertie transmission paths;
- creation of a new congestion zone to address congestion within Path 26;
- formulation of a price cap policy to eventually end the use of price caps by establishing market mechanisms to encourage competition; and
- preliminary discussions for redesign of ISO markets in 2000 to encourage accurate scheduling, increase participation by load, reduce congestion, and allow more market activity.

The Department sells spinning, nonspinning, and replacement reserves to ISO. The Department bids pump loads into nonspinning reserves to provide ISO more resources in case of system emergencies or contingencies. The Department buys and sells energy not purchased or sold through bilateral agreements in the CalPX’s day-ahead market.

Existing SWP Power Facilities

Figure 10-1 shows the names, locations, and nameplate capacity of the Department’s primary power facilities.

Hydroelectric. Economic hydroelectric generation provides the largest share of SWP power resources. The combined 759-megawatt Hyatt Pumping-Generating Plant and Thermalito Pumping-Generating Plant (Hyatt-Thermalito) generate about 2.2 billion kWh of energy in a median water year, while the 3 MW from Thermalito Diversion Dam Power Plant add another 24 million kWh of energy a year.

Generation at SWP aqueduct recovery plants—Gianelli, Alamo, Devil Canyon, Warne, and Mojave Siphon—varies with the amount of water conveyed. These five plants generate about one-sixth of the total energy used by the SWP.

Coal. Since July 1983, the Department has received energy from Reid Gardner Power Plant, a coal-fired facility near Las Vegas, Nevada. Reid Gardner consists of four units. The Department owns 67.8 percent of Unit 4, while NPC owns the remainder of Unit 4 as well as all of units 1, 2, and 3.

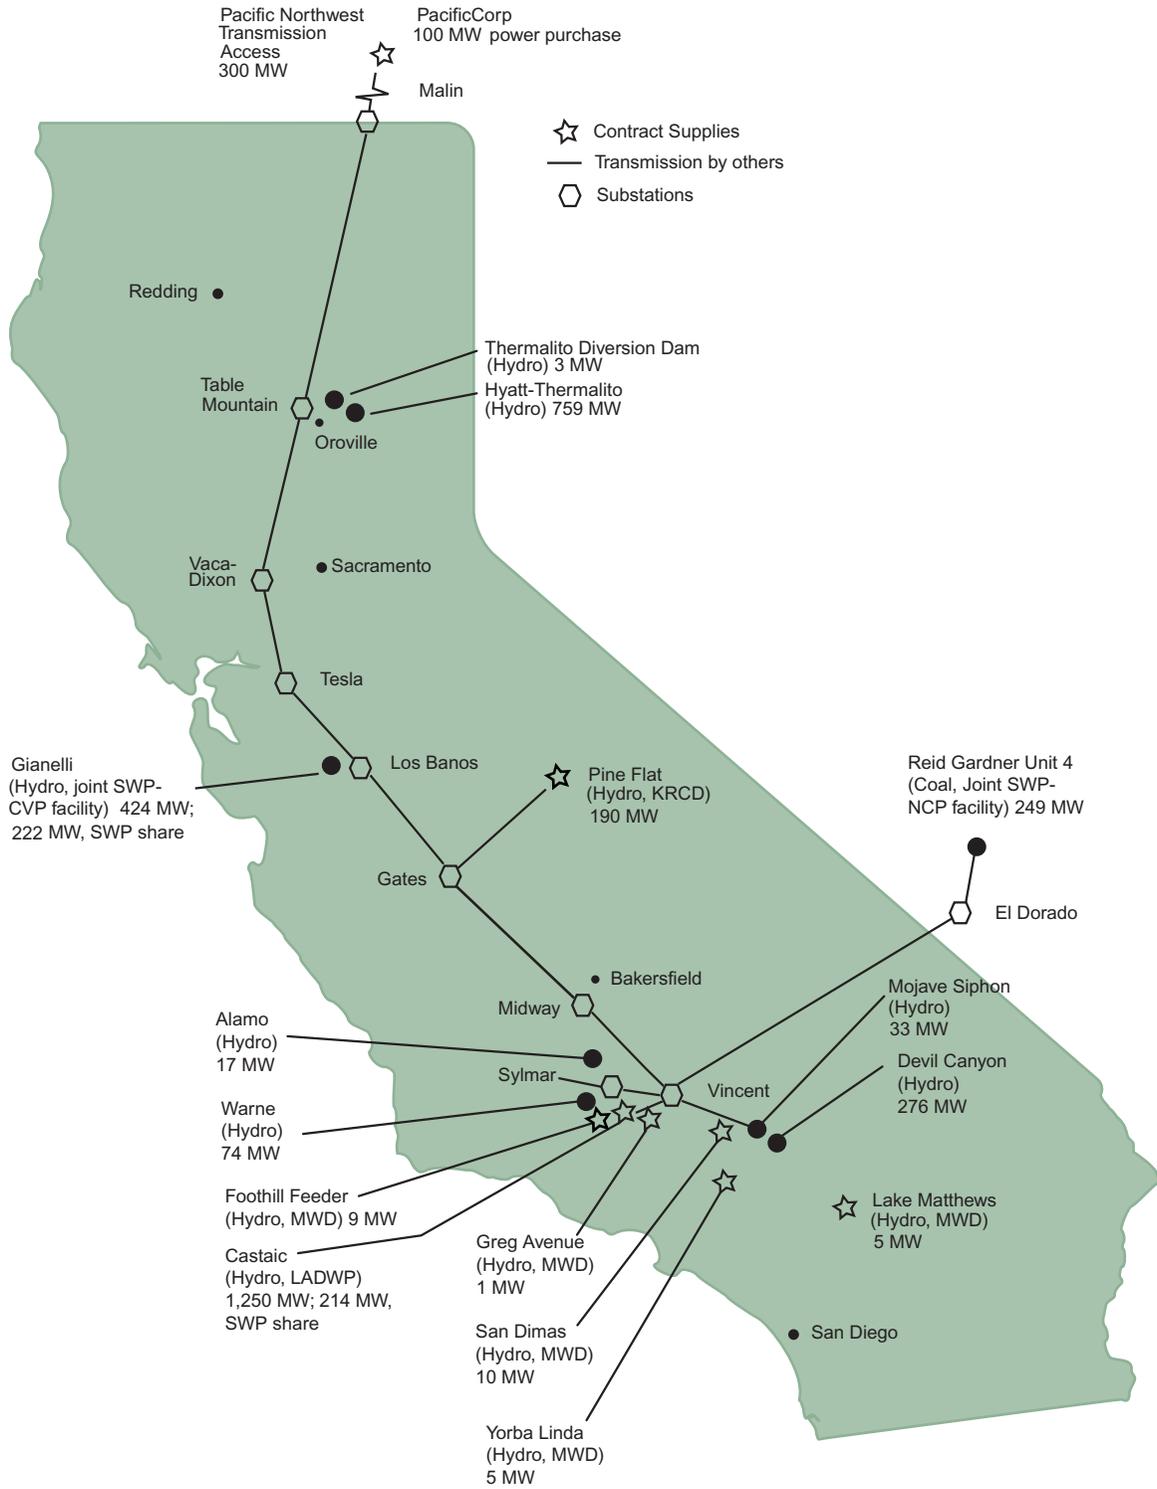

Since September 1998, the Department has received up to 249 MW (entitlement share of 90.4 percent) from Unit 4 (based on an upgraded generating capacity of 275 MW), subject to NPC’s limited right to interrupt the Department’s energy deliveries during specified periods. Whenever NPC interrupted the Department’s scheduled energy, the Department received payment based on NPC’s combustion turbine cost.

Future SWP Power Facilities

To meet future SWP power requirements, the Department also considers and evaluates new power resources, including reviewing SWP power requirements and analyzing the type of resource and its cost. Factors considered include

- ability to meet anticipated power requirements for pumping
- transmission access availability
- anticipated water deliveries to contractors
- cost of the resource

Figure 10-1
Names, Locations, and Nameplate Capacity of Primary Power Facilities

- availability and cost of financing
- environmental impacts and costs of mitigation
- operating characteristics

The Department continues to consider several potential power resources. These include a second unit at Alamo Power Plant, a third unit at Warne Power Plant, and additional capacity at Hyatt-Thermalito.

Contractual Resource Arrangements

Through joint development, exchanges, and purchases the Department obtains a significant amount of capacity and energy for SWP operations from other utilities throughout California, the Northwest, and the Southwest. Under these agreements, the Department can sell, buy, or exchange energy.

Some agreements allow the Department to sell, buy, and/or exchange short-term firm capacity and/or firm energy on an hourly, daily, weekly, or monthly basis. Those agreements permit more efficient use of the Department's generating resources and more efficient scheduling of energy deliveries.

Negotiations continue with various utilities in the Pacific Northwest to develop arrangements for purchases, sales, and exchanges to take advantage of the Department's 300 MW transmission capacity on the Extra-High Voltage Pacific Northwest Intertie.

Joint Developments. In 1966, the Department entered into a contract with the Los Angeles Department of Water and Power for the joint development of the West Branch of the California Aqueduct. LADWP constructed and operates Castaic Power Plant, which is connected to the LADWP transmission system at the Sylmar Substation.

The Department receives capacity and energy at the Sylmar Substation based on weekly water schedules through the West Branch.

Gianelli Pumping-Generating Plant is a joint SWP (222 MW) and U.S. Bureau of Reclamation (202 MW) facility.

Power Exchanges. The largest portion of the energy used by the SWP is provided by the 1979 Power Contract and the 1981 Capacity Exchange Agree-

ment with SCE. Service began in April 1983 under the power contract and in April 1987 under CEA.

According to terms of the power contract, the Department provides SCE with up to

- 350 MW of capacity and approximately 40 percent of the energy from Hyatt-Thermalito
- 120 MW of capacity and all the energy generated by Devil Canyon Power Plant Units 1 and 2
- 15 MW of capacity and all the energy generated by Alamo Power Plant

In return, the Department receives off-peak energy from SCE equal to the amount of energy provided to SCE from Hyatt-Thermalito, Devil Canyon Power Plant, and Alamo Power Plant, plus an additional amount of energy as payment for the capacity. The amount of additional energy is determined annually, based on the Capacity-Energy Exchange Formula as defined in the 1979 Power Contract. The formula determines the value of capacity in dollars and converts the dollar amounts into an equivalent amount of off-peak energy.

According to terms of the CEA, each year the Department must provide 412.5 million kWh of energy to SCE during on-peak periods at a maximum delivery rate of 225 MW. SCE returns approximately 110 percent of the energy the Department provides during mid-peak and off-peak periods. In addition, SCE waives 75 percent of its charges to the Department for specified firm transmission service provided to SWP pumping and generating facilities. SCE also makes an annual payment of \$900,000 to the Department.

In addition, according to terms of the 1979 Power Contract, SCE receives energy from four of the Metropolitan Water District of Southern California power plants—Lake Mathews, Foothill Feeder, San Dimas, and Yorba Linda. In return, the Department receives off-peak energy from SCE averaging 107 percent of the total energy provided to SCE from those plants. All the energy from the fifth plant, Greg Avenue, is provided to LADWP according to a 1983 agreement between LADWP and the Department. The utility returns 98.8 percent of this energy to the Department during off-peak periods.

Purchases. The Department obtains a significant amount of energy through long-term and short-term purchase agreements with utilities in California, the Northwest, and the Southwest.

Long-Term Purchases. The Department purchases hydroelectric energy generated by other utilities. The output of the 165 MW Pine Flat Power Plant, owned and operated by Kings River Conservation District, supplies the SWP about 400 million kWh of energy in median water years.

The Department contracts for the energy output of five hydroelectric plants owned and operated by MWD. The total capacity of those plants is 30 MW. To use this resource efficiently, the Department included it in the exchange arrangements with SCE.

Beginning in late 1983, the Department purchased wind-generated energy from TERA Power Corporation. The energy was delivered from the Bethany Wind Park to the South Bay Pumping Plant near Tracy. Originally TERA installed 168 wind machines, with a total capacity of 9.45 MW. However, because of mechanical failures and subsequent litigation involving the developer, investors, and manufacturers, many machines have been out of service since 1987. The Department terminated the contract in early 1996 due to a contract breach by TERA Power Corporation and proposed dismantling and removing the wind park facilities.

The Department signed an agreement with PacifiCorp of Portland, Oregon, to purchase 100 MW of firm capacity and associated energy. That agreement became effective June 1, 1991, and will continue through 2004.

Short-Term Purchases. Additionally, according to terms of the 1988 Coordination Agreement between the Department and MWD, the Department may purchase surplus energy from MWD's Colorado River Aqueduct system. The Coordination Agreement provides for coordinated operation between the SWP and MWD's Colorado River Aqueduct system. It also provides for

- monthly surplus firm energy sales to MWD;
- economy energy sales to MWD;

- surplus energy purchases from the Colorado River Aqueduct system; and
- energy exchanges between the Department and MWD.

The Department also has the Western System Power Pool agreement with member utilities to purchase interruptible economy energy to satisfy unexpected, short-term energy shortages and to sell surplus short-term energy.

Contractual Transmission Arrangements

Although able to acquire transmission independently, the Department depends on other sources for transmission services. PG&E and SCE are the Department's primary providers of transmission service between SWP power resources and pumping loads and interconnected utilities for purchases, sales, and exchanges of power.

Under the Comprehensive Agreement with PG&E, the Department receives 1,355 MW of firm transmission service over the PG&E transmission system between SWP pump loads and power resources in Northern and Central California. The agreement allows the Department to request and receive additional firm and interruptible transmission service if needed.

To interconnect the SWP loads and resources in Southern California, the Department receives transmission service from SCE over the SCE transmission system under the SCE-DWR Power Contract and Firm Transmission Service Agreement.

In August 1967, the Department contracted for 300 MW of transmission capacity on the Extra-High Voltage Pacific Northwest Intertie from the California-Oregon border to the Table Mountain, Tesla, Los Banos, and Midway substations. The Department retains its entire 300 MW share of EHV capacity for access to the Pacific Northwest until 2005; 100 MW of this capacity is committed to receiving the long-term purchase of 100 MW from PacifiCorp.

In December 1984, the Department signed a Memorandum of Understanding with many public and private California utilities. As implemented in the Interim Participation Agreement and the Long-Term

Participation Agreement, the Department has an option (which can be exercised during a 5-year period beginning in January 2005) to purchase 97 MW of transmission capacity on the third 500 kV transmission line that connects California with the Pacific Northwest. The transmission line began operation March 17, 1993.

Other SWP transmission needs are met by contractual arrangements with California utilities.

Load Management

The SWP controls the timing of its pumping load through an extensive computerized network. That control system allows the Department to minimize the cost of power it purchases by maximizing pumping during off-peak periods, when power costs are lower—usually at night—and by selling power to other utilities during on-peak periods, when power values are high. By taking advantage of this flexibility in scheduling SWP pumping load and generation, the Department reduces the net cost of power needed for SWP water deliveries.

Sales of Excess Power. When generation from SWP power resources exceeds requirements, the Department sells the excess power on the open market. Currently, the Department contracts with utilities and marketers for short-term purchase, sale, or exchange of power. In addition to selling firm power, the Department may sell power on a day-to-day or hour-to-hour basis according to the terms of its interchange agreements and of the Western System Power Pool Agreement. These agreements provide the basis for making economical energy transactions, short-term capacity and energy sales or exchanges, unit commitments, and transmission service purchases. Through these contracts, the Department sells excess capacity and energy at market rates. In 1999, the Department also bought and sold through the CalPX market excess energy not sold through bilateral agreements.

SWP Power Operation in 1999

Tables 10-1 through 10-4 present statistical information about SWP power operation for calendar year 1999, including energy consumed and generated, energy exchanged and purchased, and energy sold.

Energy Consumed

In 1999, energy used at the 25 SWP pumping and generating plants totaled 5.76 billion kWh.

Table 10-1 shows the amount of energy used each month at SWP pumping and generating plants to operate the SWP in 1999.

According to terms and conditions of various water conveyance contracts and exchange agreements, some water belonging to the Central Valley Project is pumped through the SWP Banks Pumping Plant and through the CVP and SWP joint-use facilities at Dos Amigos Pumping Plant and Gianelli Pumping-Generating Plant. USBR furnishes the energy for pumping this water.

Energy Generated

Table 10-2 shows amounts of energy generated at SWP facilities in 1999, as well as energy purchased for SWP operations.

Hydroelectric and Coal. The Hyatt-Thermalito power complex in Oroville produces a large amount of SWP energy. In 1999, Hyatt-Thermalito generated 2.95 billion kWh of energy.

Energy generated at SWP recovery plants—Alamo, Devil Canyon, Castaic, Mojave Siphon, and Warne—totaled 1.32 billion kWh in 1999.

In 1999, the SWP share of energy generated at the coal-fired Reid Gardner Unit 4 totaled 1.6 billion kWh of energy.

Contractual Resource Arrangements

SWP power operations rely on contractual arrangements as well as SWP facilities. Those contractual arrangements include joint development projects, energy exchanges, purchases, and transmission.

Joint Development. Through the West Branch Cooperative Development Agreement with LADWP, the Department receives energy based on the amount of water scheduled through the West Branch. In 1999, LADWP provided 372 million kWh of energy for the Department's share of energy generated at Castaic Power Plant.

^a Received from San Bernardino Valley Municipal Water District due to generation lost by Southern California Edison which was replaced by the Department.				

In 1999, the Department's share of Gianelli Pumping-Generating Plant used 143 million kWh and generated 183 million kWh of energy.

Energy Exchanges. The Department has two agreements with SCE to purchase and/or exchange power. According to terms of the 1979 Power Contract (in effect since April 1983), part of the output of Devil Canyon Power Plant and the Hyatt-Thermalito complex and all output of Alamo Power Plant are delivered to SCE. According to the terms of the Capacity Exchange Agreement (in effect since April 1987), the Department delivers energy to SCE each year during on-peak periods and, in return, receives a greater amount of off-peak energy as well as transmission considerations. Those two exchange agreements resulted in a net of about 2.17 billion kWh of energy to the SWP in 1999.

Purchases and Costs. In 1999, the Department purchased 1.77 billion kWh of energy at a cost of \$31.28 million. Associated costs for capacity totaled \$21.17 million. Other SWP power costs, including transmission, operation, maintenance, and ISO ancillary services totaled \$86.54 million. This amount includes \$5.23 million and \$3.27 million for debt service and operations and maintenance costs, respectively, at Pine Flat Power Plant. It also includes \$46.6 million for costs associated with operations and maintenance, fuel, insurance, and property taxes at Reid Gardner Unit 4. Table 10-3 shows amounts of power, transmission, and other services purchased in 1999 and costs of purchases, by area. Table 10-3 also reflects the restructuring of the electric industry through transactions with CalPX and the ISO and through new charges, such as grid management and ancillary services charges.

Long-Term Purchases. According to terms of the Kings River Conservation District contract, the Department receives the total output of the 165 MW Pine Flat Power Plant. In 1999, the power plant provided 394.42 million kWh of energy to the SWP at a total cost of \$11.50 million.

In 1999, the Department purchased 614.42 million kWh of energy at a cost of \$30.35 million, under a contract for firm energy with PacifiCorp.

Under the MWD Small Hydro Contract, the Department purchased 137.39 million kWh of energy in 1999 from five small hydroelectric power plants on the MWD system at a cost of \$5.86 million.

Long-term purchases are shown in Table 10-3.

Short-Term Purchases. Existing resources and long-term power and transmission contracts ensure that the SWP has enough power to meet long-term needs. When SWP power requirements exceed resources during daily operations, short-term purchases meet the difference. In 1999, the SWP purchased short-term energy from 10 marketers. The short-term energy purchases totaled 457.16 million kWh (Table 10-3).

Sales of Excess Power

In 1999, the Department sold 4.23 billion kWh of energy to 27 utilities and 13 power marketers for total revenues of \$104.15 million. The Department also received \$22.36 million in revenues for capacity, exchanges, and transmission arrangements, including \$18.91 million for transactions made through ISO. See Table 10-4 for information about energy and other services sold and revenue received, including those sold to CalPX and ISO.

Forecasting Power Operations

Each year, after reviewing the water contractors' water delivery requests and the construction schedule for future facilities, the Department forecasts SWP power requirements through 2035, paying particular attention to forecasts through 2004, the year major power contracts expire.

Actual SWP power requirements may vary significantly from the amounts forecast. Those variations are due to the amount of water available and delivered in a given year. For example, dry conditions in Northern California could result in a reduction of the amount of water available for delivery. If full deliveries cannot be made, less power will be used than was originally forecasted. Power requirements could also decrease during a wet year because of the availability of the water in the San Joaquin Valley or Southern California.

Conversely, power requirements could exceed the amount originally forecasted if actual water deliveries are greater than the amounts estimated. For example, if additional pumping is needed to refill reservoirs south of the Delta after an unexpected dry year, more power will be used than was initially forecast.

Criteria

The Department bases its forecast of electric power primarily on SWP pumping power requirements to deliver water for SWP contractors' short-term and long-term water delivery requests. Requirements are

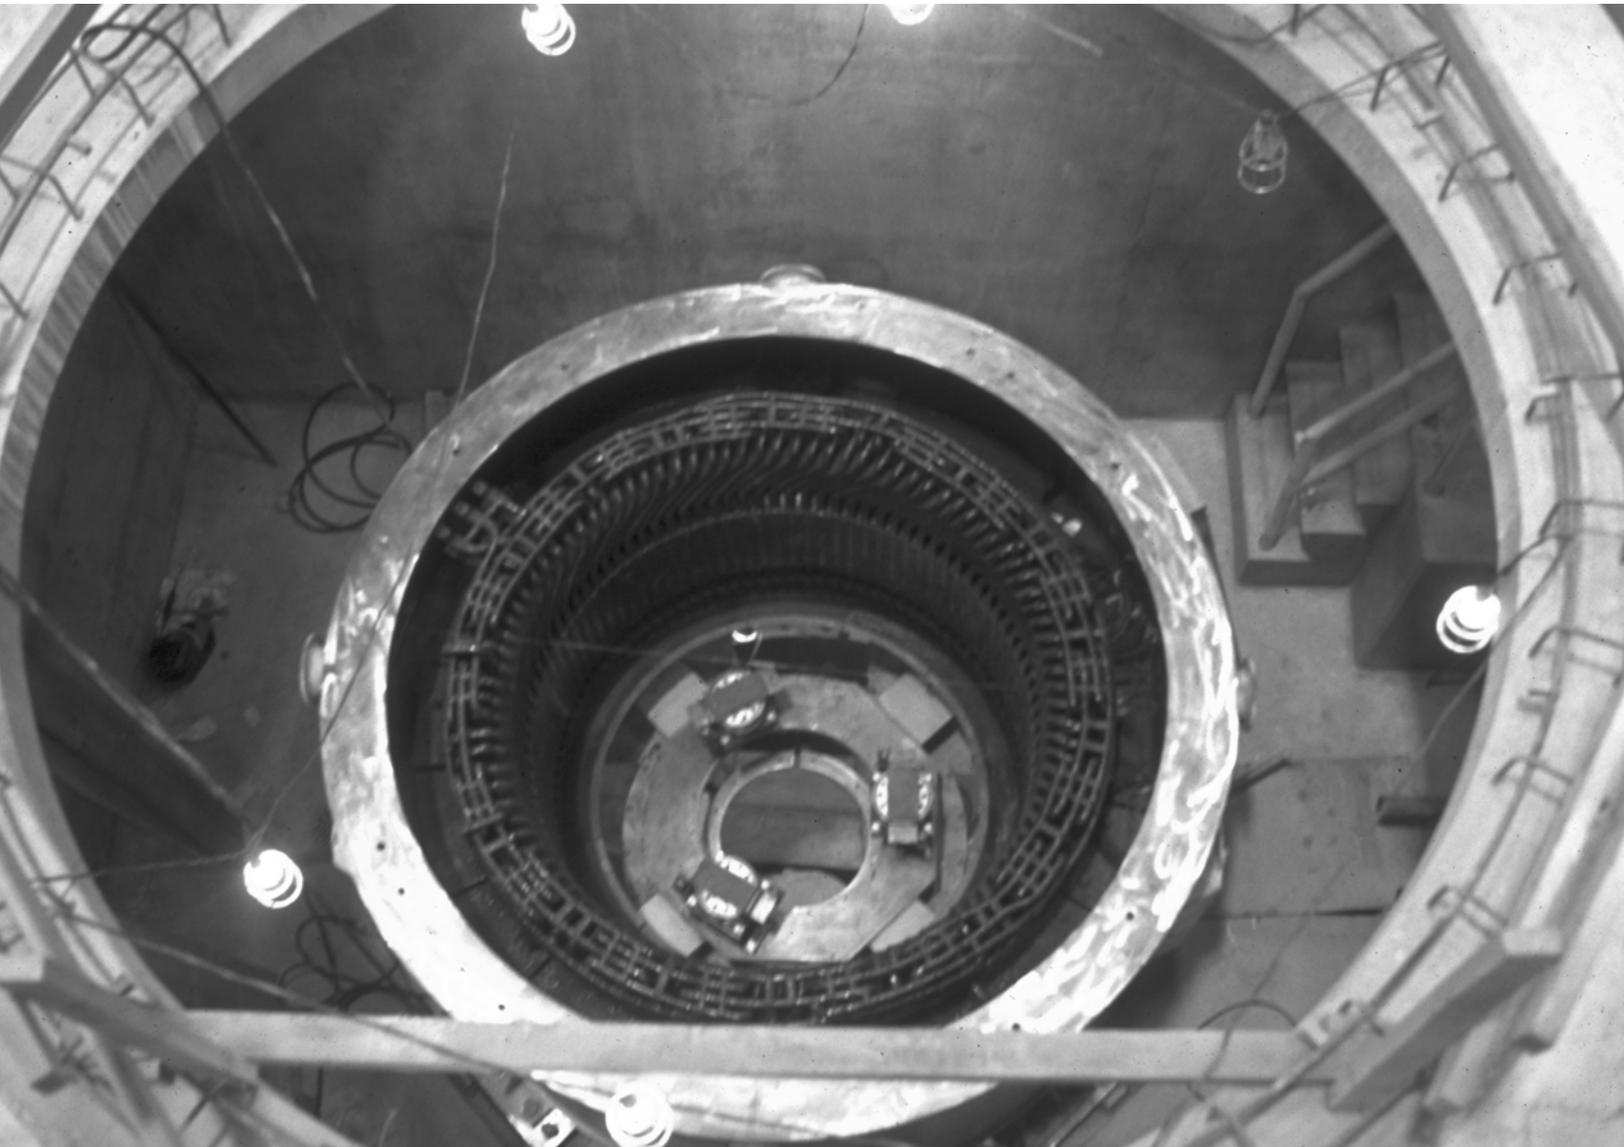

based on the amount of energy necessary to deliver entitlement water requested by water contractors, including losses in reservoirs and aqueducts, recreation water, and water to replace storage in reservoirs south of the Delta.

Short-term power requirements, based on the actual water supply and reservoir storage levels, are determined for the current and 2 ensuing years of operation. Long-term operational studies for the remaining years are based on median-year water-supply conditions and optimal reservoir storage levels.

Information for this chapter was provided by the State Water Project Analysis Office.

Chapter 11

Facilities Maintenance

Top view of motor installed at Oso
Pumping Plant

Significant Events

- In May 1999, the Director's Safety Review Board met and evaluated Oroville, Bidwell Bar, Lime Saddle, Thermalito Diversion, Thermalito Forebay, Thermalito Afterbay, and Feather River Hatchery Dams.
- Routine inspections were conducted by staff from both the Division of Operations and Maintenance and the Division of Safety of Dams at Frenchman, Antelope, and Grizzly Valley Dams in the Upper Feather River Area; at Oroville, Bidwell Bar, Lime Saddle, Thermalito Diversion, Thermalito Forebay, Thermalito Afterbay, and Feather River Hatchery Dams in the Oroville area; at Clifton Court, Bethany, Patterson, and Del Valle Dams in the Delta Field Division; at Sisk, O'Neill, Los Banos, and Little Panoche Detention Dams in the San Luis Field Division (O&M and U.S. Bureau of Reclamation); at Cedar Springs Dam; and at Devil Canyon Power Plant Second Afterbay, Warne Power Plant (O&M and Federal Energy Regulatory Commission), and Perris Dams in the Southern Field Division.

The Department of Water Resources, through the Division of Operations and Maintenance, monitors all State Water Project facilities to ensure safety and reliability. Staff also conduct annual, biannual, and quinquennial inspections and make reports on facilities to document any deficiencies. These inspections allow facilities to be maintained at the highest level possible with available staff and resources. Finally, the Department is required, under federal and State law, to contract periodically with independent consultants to review the safety of SWP dams and power facilities.

The Department conducts several types of inspections of SWP facilities. O&M staff collect and evaluate data about the performance of each facility. Engineers from DSOD review instrumentation data and inspect jurisdictional SWP dams annually to ensure that each dam is satisfactory for continued safe operation. The engineers evaluate proposed modifications to existing dams as well as the design and construction of new jurisdictional dams.

The Department is required to contract periodically with independent consultants to review the safety of SWP dams and power facilities, except those in the San Luis Field Division and the Pearblossom Spill Basin. The four dams in the San Luis Field Division (San Luis, O'Neill Forebay, Los Banos Detention, and Little Panoche) are used jointly with USBR, and are not currently under the jurisdiction of DSOD. Pearblossom Spill Basin Dam was originally designed to be used during misoperation at the Pearblossom Pumping Plant. The spill basin was never fully completed and has never been used.

FERC inspects all licensed SWP facilities annually. These inspections include a review of significant events, instrumentation data, and the visual appearance of each dam, penstock, power plant, etc.

Inspecting and Maintaining Project Dams

During 1999, Department personnel inspected and performed routine and scheduled maintenance on SWP dams. DSOD inspects SWP dams annually with

O&M personnel to ensure that each dam is safe for continued operation. Engineers from DSOD evaluate proposed modifications to existing dams. FERC engineers inspect FERC-licensed SWP facilities annually. Some inspections were conducted under FERC and California Water Code requirements to evaluate SWP dam facilities every 5 years. Other routine inspections were performed by O&M as well.

Routine Inspections

Routine inspections were conducted by O&M and DSOD staff at Frenchman, Antelope, and Grizzly Valley Dams in the Upper Feather River Area; at Oroville, Bidwell Bar, Lime Saddle, Thermalito Diversion, Thermalito Forebay, Thermalito Afterbay, and Feather River Hatchery Dams in the Oroville area; at Clifton Court, Bethany, Patterson, and Del Valle Dams in the Delta Field Division; at Sisk, O'Neill, Los Banos, and Little Panoche Detention Dams in the San Luis Field Division (O&M and USBR); at Cedar Springs Dam; and at Devil Canyon Power Plant Second Afterbay, Warne Power Plant (O&M and FERC), and Perris Dams in the Southern Field Division.

Independent Reviews

California Water Code Reviews. To comply with the California Water Code and the California Code of Regulations, the Department is required to retain a consulting board to review

- the adequacy of the design of any dam or reservoir the Department proposes to construct; and

- the safety of the completed construction, including the terms and conditions for the Certificate of Approval.

These provisions require the Department to retain a board of three consultants at least once every 5 years to review the operational performance of Department-owned dams. The board of consultants independently reviews and assesses safety conditions of SWP dams. These inspections include a review of significant events, instrumentation data, and the visual appearance of each dam, penstock, power plant, etc. Consultants are selected based on their geotechnical, structural, and civil engineering knowledge and background as well as their expertise in evaluating the performance of dams.

In preparing their reports, consultants inspect facilities and review surveillance data and other information prepared by departmental staff. The Department then prepares action plans based on the consultants' recommendations.

In May 1999, the Director's Safety Review Board met and evaluated Oroville, Bidwell Bar, Lime Saddle, Thermalito Diversion, Thermalito Forebay, Thermalito Afterbay, and Feather River Hatchery Dams.

Three boards of consultants were convened to review the plans for the construction of Crafton Hills Dam on the East Branch of the SWP.

FERC Reviews. To comply with FERC regulations, consultants review FERC-licensed dams and power generation facilities owned by the Department. They also inspect facilities and review surveillance data and other information prepared by Department staff. The Department then prepares action plans based on the consultants' recommendations. These reviews, which may be conducted by one or more consultants, are scheduled every 5 years. In May 1999, the third 5-year FERC safety consulting board inspection for the Oroville-Thermalito Complex was conducted. In September 1999, the fifth 5-year FERC safety consulting board inspected the Castaic-Devil Canyon power complex.

Maintaining Other Project Facilities

The Department continually monitors all SWP facilities and performs repairs and modifications as necessary to ensure safe, reliable water delivery. Headquarters' staff conduct biannual inspections of project facilities and complete inspection reports for each field division. The Oroville and San Joaquin field divisions are inspected in the spring and summer of even-numbered years and the Delta, San Luis, and Southern field divisions are inspected in odd-numbered years. Each report lists action items to ensure that follow-up inspections and reports are made.

Arroyo Pasajero Program

The Arroyo Pasajero and its tributaries drain approximately 530 square miles of the Coast Mountains west of the California Aqueduct in Fresno County. The Arroyo Pasajero's downstream juncture with the California Aqueduct, also known as the San Luis Canal between San Luis Reservoir and Kettleman City, poses a particularly difficult operational and maintenance problem for the SWP. During periods of heavy rainfall, high flows in the Arroyo Pasajero and its tributaries transport heavy sediment loads eroded from the mountains. Over many eons, sediment transported by Arroyo floods formed a 450-square-mile alluvial fan extending from its apex at the eastern margin of Pleasant Valley (Anticline Ridge) to the San Joaquin Valley trough. The California Aqueduct traverses the Arroyo's alluvial fan and forms a barrier to Arroyo flood flows. Flood control facilities include a detention basin designed to store storm runoff and sediment upstream of the Aqueduct, a siphon to release floodwaters east of the Aqueduct, and drain inlets to release floodwaters into the Aqueduct. The volume of runoff and sediment deposition are much greater than estimated during the original design of the detention basin in the mid-1960s.

USBR designed and constructed the San Luis Canal segment of the California Aqueduct, and the Department shares costs of operating and maintaining the facility. Since the floods of 1969, USBR and the Department have worked to minimize the effects of heavy flooding. In 1980, asbestos was discovered in the Metropolitan Water District of Southern California's water supply and traced to runoff from the

Arroyo Pasajero and other Diablo range streams. This discovery, in conjunction with the high cost of removing sediment from the Aqueduct, led the Department to adjust operating procedures to minimize runoff entering the Aqueduct.

Long-Term Programs. In 1990, the Department sought the assistance of the U.S. Army Corps of Engineers to identify viable long-term solutions to the Arroyo Pasajero flooding and sediment problems. In 1992, the Corps issued the *Arroyo Pasajero Reconnaissance Report*, which demonstrated a federal interest in flood control at Arroyo Pasajero. The feasibility study—started in 1994 as a joint effort among the Corps, the Department, and USBR—provides a more rigorous analysis of the flooding and sedimentation problems and evaluates potential solutions in greater detail. The study is ongoing, with a projected cost of \$7.86 million. The Department, as local sponsor, is committed to 50 percent of the total study cost, with one-half of this commitment met by providing in-kind services for the study. Under the Department’s agreement with USBR for the Joint-Use Facilities of the San Luis Unit, USBR pays 45 percent of the Department’s study cost.

A draft Feasibility Report/Environmental Impact Statement/Environmental Impact Report was released to the public in March 1999. A public meeting on the document was held in April 1999. Two candidate plans demonstrating a federal interest were presented:

- the enlarged Westside Detention Basin as the Corps’ national economic development plan, at an estimated cost of \$238 million and benefit-to-cost ratio of 1.7:1; and
- the Pasajero Gap Detention Dam as a possible locally preferred plan, at an estimated cost of \$225 million and a benefit-to-cost ratio of 1.2:1.

Compelling comments opposing both candidate plans were received from the public and from agencies: (1) The enlarged Westside Detention Basin alternative was criticized for discharging floodwater taken across the Aqueduct to a location inconsistent with recent historical pre-Aqueduct flooding patterns and was determined to be an unacceptable solution. (2) The U.S. Fish and Wildlife Service and the California Department of Fish and Game deemed that the

adverse impacts to listed species in the vicinity of the Pasajero Gap Dam and Reservoir could not be mitigated. Consequently, the Gap Dam was determined to be unacceptable.

The investigation then focused on two different alternatives. One, estimated to cost in excess of \$300 million, would provide significantly greater flood storage west of the Aqueduct. Another more promising plan would rely on some increased storage west of the Aqueduct by taking a portion of the floodwater into the Aqueduct and conveying it south as storage. The storage facility would be constructed on less productive farmland down slope of the Aqueduct near Kettleman City. With this direction in the investigations, federal authorization for a new project is not expected prior to a possible Water Resources Development Act in 2002.

The Department, with the support of the State Water Contractors, has continued to provide funds and staff support to a Coordinated Resource Management Plan group called the Stewards of the Arroyo Pasajero Watershed. The mission of CRMP is “to improve the Arroyo Pasajero watershed through erosion and sediment control by implementing improved land management practices that will sustain and promote the aesthetics, environmental quality, and economic viability of the watershed.” It is believed this watershed management program will increase watershed infiltration and decrease erosion, complementing any structural flood control improvements and reducing the threat Arroyo Pasajero poses to the California Aqueduct and surrounding communities.

Cantua Creek Stream Group. The Department constructed interim measures to reduce flood water and sediment inflows to the San Luis Canal from the Cantua and Salt Creek drain inlets. By slightly resizing the western embankment and excavating to maximize the effectiveness of existing flood easements and by constructing decanting weirs upstream of the existing drain inlets, the impounding capacity of the existing ponding basins prior to releases into the Aqueduct can be enlarged approximately 10 times, providing up to a 10-year flood impoundment. These measures will prevent significant volumes of sediment from being transported into the Aqueduct during more frequent floods.

The reconnaissance study for flood control measures on Martinez, Domengine, Salt and Cantua Creeks, and on Arroyo Hondo and Arroyo Ciervo is largely on hold pending further progress on the Arroyo Pasajero project. A preliminary draft reconnaissance report on Tumey Gulch is being prepared to supplement the preliminary draft report on the other five drainages. The most cost-effective solution for these drainages is expected to be dependent upon the final plan adopted for Arroyo Pasajero. During the

interim, activity will likely be limited to selective acquisition of flood right-of-way along the west side of the Aqueduct.

Repairs and Modifications. Table 11-1 presents information, arranged chronologically, about significant scheduled and unscheduled outages at SWP pumping and power plants in 1999. The table includes information about incidents resulting in outages exceeding 14 days.

**Table 11-1
Outages for Maintenance and Repair of Facilities in 1999, by Month**

<i>Month</i>	<i>Facility</i>	<i>Description</i>
January	Pearblossom Pumping Plant	Units 1, 2, 4, 5, 6, 8, and 9 out of service from January 4 to March 3 due to Pool 59 repairs.
	Chrisman Pumping Plant	Unit 8 out of service from January 4 to May 24 for transformer KYD rewind.
	Alamo Power Plant	Unit 1 out of service from January 5 to March 2 to inspect seals and rebuild governor.
	Devil Canyon Power Plant	Unit 2 out of service from January 11 to March 5 for annual maintenance.
	Las Perillas	Units 1, 2, and 4 out of service from January 11 to February 17 to replace motor switchgear.
	Las Perillas	Unit 3 out of service from January 11 to February 18 to replace motor switchgear.
	Badger Hill Pumping Plant	Units 1, 2, 3, and 4 out of service from January 17 to February 17 to replace motor switchgear.
	Hyatt Power Plant	Unit 3 out of service from January 19 to April 13 for annual maintenance.
February	Thermalito Diversion Dam Power Plant	Unit 1 out of service from February 8 to March 5 to install new annunciator.
	Thermalito Pumping-Generating Plant	Unit 1 out of service from February 9 to April 16 for annual maintenance.
	Devil Canyon Power Plant	Unit 3 out of service from February 16 to March 16 for unit warranty work.
	Las Perillas Pumping Plant	Unit 5 out of service from February 19 to March 23 to install new motor switchgear.
	Las Perillas Pumping Plant	Unit 6 out of service from February 19 to March 24 to install new motor switchgear.
	Badger Hill Pumping Plant	Units 5 and 6 out of service from February 19 to March 23 to install new motor switchgear.
March	Dos Amigos Pumping Plant	Unit 1 out of service from March 1 to April 30 to repair leaking discharge line.
	Edmonston Pumping Plant	Unit 12 out of service from March 8 to April 1 to replace circuit breaker.
	Mojave Siphon Power Plant	Unit 1 out of service from March 15 to June 11 to install isolation flange on No. 1 line.
	Barker Slough Pumping Plant	Units 2 through 9 out of service from March 17 to April 17 to clean Travis Tank.
	Cordelia Pumping Plant	Units 1 through 11 out of service from March 17 to April 19 to clean Travis Tank.

Table 11-1 (Continued)
Outages for Maintenance and Repair of Facilities in 1999, by Month

<i>Month</i>	<i>Facility</i>	<i>Description</i>
April	Chrisman Pumping Plant	Unit 2 out of service from March 31 to April 23 to replace discharge valve downstream seat "O" ring.
	Barker Slough Pumping Plant	Unit 1 out of service from April 1 to April 16 to clean Travis Tank.
	Edmonston Pumping Plant	Unit 10 out of service from April 5 to April 25 to replace motor breaker.
	Devil Canyon Power Plant	Unit 2 out of service from April 5 to April 20 for generator breaker maintenance.
	Pearblossom Pumping Plant	Unit 4 out of service from April 5 to July 20 to investigate pump casing leak and repair pump.
	South Bay Pumping Plant	Unit 3 out of service from April 9 to April 27 to inspect thrust bearing and repair resistance temperature detector lead.
	Hyatt Power Plant Reid Gardner Unit No. 4	Unit 5 out of service from April 14 to May 19 for annual maintenance. Unit out of service from April 30 to May 24 for annual maintenance.
May	Thermalito Pumping-Generating Plant	Unit 4 out of service from May 3 to May 25 for annual maintenance.
	Edmonston Pumping Plant	Unit 4 out of service from May 10 to June 24 to retrofit circuit breaker.
	Oso Pumping Plant	Unit 3 out of service from May 24 to June 9 to replace leaking discharge valve operating seat "O" ring.
June	Thermalito Diversion Dam Power Plant	Unit 1 out of service from June 2 to June 24 for annual maintenance.
July	Pearblossom Pumping Plant	Unit 9 out of service from July 13 to December 14 to inspect pump mechanical shaft seal and repair pump head cover damage.
	Edmonston Pumping Plant	Unit 5 out of service from July 26 for stator rewind. Completion expected in 2000.
August	Thermalito Diversion Dam Power Plant	Unit 1 out of service from August 9 to September 21 to replace interrupter switch.
September	Cordelia Pumping Plant	Unit 1 out of service from September 7 to replace motor power factor correction capacitor that had failed. Completion expected in 2000.
	Gianelli Pumping-Generating Plant	Unit 2 out of service from September 7 to December 17 for biennial maintenance and breaker replacement.
	Edmonston Pumping Plant	Unit 8 out of service from September 13 to retrofit unit breaker. Completion expected in 2000.
	Teerink Pumping Plant	Unit 8 out of service from September 21 for annual maintenance. Completion expected in 2000.
October	Hyatt Power Plant	Unit 2 out of service from October 4 to November 5 for annual maintenance.
	Thermalito Pumping-Generating Plant	Unit 1 out of service from October 4 to November 10 for annual maintenance.
	Gianelli Pumping-Generating Plant	Unit 3 out of service from October 6 to October 28 for work on amortisseur winding.
	Dos Amigos Pumping Plant	Unit 1 out of service from October 9 to October 25 to inspect leaking vane control oil head.

Table 11-1 (Continued)
Outages for Maintenance and Repair of Facilities in 1999, by Month

<i>Month</i>	<i>Facility</i>	<i>Description</i>
November	Gianelli Pumping-Generating Plant	Unit 1 out of service from November 1 to December 7 to replace main breaker.
	Dos Amigos Pumping Plant	Unit 2 out of service from November 1 to November 24 for biennial maintenance.
	Chrisman Pumping Plant	Unit 4 out of service from November 1 for transformer KYB work. Completion expected in 2000.
	Chrisman Pumping Plant	Unit 5 out of service from November 1 to December 3 for transformer KYB work.
	Devil Canyon Power Plant	Unit 3 out of service from November 3 for annual maintenance. Completion expected in 2000.
	Hyatt Power Plant	Unit 4 out of service from November 8 to December 30 for annual maintenance.
	Mojave Siphon Power Plant	Unit 1 out of service from November 8 to November 23 for annual maintenance.
	Chrisman Pumping Plant	Unit 7 out of service from November 10 to repair motor stator windings. Completion expected in 2000.
	Chrisman Pumping Plant	Unit 9 out of service from November 10 to replace impeller. Completion expected in 2000.
	Thermalito Pumping-Generating Plant	Unit 2 out of service from November 15 to December 30 for annual maintenance.
	Badger Hill Pumping Plant	Units 1, 2, 3, and 4 out of service from November 15 to December 13 to replace discharge valve on Units 1, 2, and 3.
	Pine Flat Power Plant	Units 1, 2, and 3 out of service from November 16 to December 9 for plant and switchyard maintenance.
	Teerink Pumping Plant	Unit 1 out of service from November 24 to December 22 to repair motor air cooler water supply pipe.
	Edmonston Pumping Plant	Unit 9 out of service from November 22 to replace unit breaker. Completion expected in 2000.
	Warne Power Plant	Unit 2 out of service from November 29 to December 23 for annual maintenance.
	December	South Bay Pumping Plant
Dos Amigos Pumping Plant		Unit 1 out of service from November 30 for discharge valve work and oil leak repairs. Completion expected in 2000.
Pine Flat Power Plant		Unit 1 out of service from December 14 for annual maintenance. Completion expected in 2000.
Las Perillas Pumping Plant		Units 1, 2, 3, and 4 out of service from December 15 to replace discharge valve on Units 1, 2, and 3. Completion expected in 2000.
Banks Pumping Plant		Units 1, 2, and 3 out of service from December 16 for repair work on Unit 3. Completion expected in 2000.

Information for this chapter was provided by the Division of Operations and Maintenance and the Division of Safety of Dams.

Chapter 12

Engineering and Right of Way

Santa Ana Pipeline modifications

Significant Events

- Construction of the East Branch Extension started on February 26, 1999, with the issuance of a Notice to Begin Work for a contract to construct pipeline Reaches 1 and 2. This was the first of 14 contracts for this project that will be awarded during the next 18 months. It is anticipated that the project will be operational in fall 2002. As of December 31, 1999, eight contracts had been awarded. The official groundbreaking ceremony took place on August 23, 1999.
- Fabrication of a 54-inch-diameter steel pipe for the East Branch Extension started on May 26, 1999. A total of 1,100 sections will be required for this project. As of December 31, 1999, more than 800 sections were in the fabrication process.
- Division of Engineering staff participated in the steady-state flow test performed on the East Branch of the California Aqueduct in December 1999. This test was part of ongoing studies to increase the flow capacity of the East Branch.
- Division personnel investigated, designed, and inspected construction of various urgent canal and facilities repair contracts.

Construction of the initial facilities of the State Water Project began in 1957 with the relocation of the Western Pacific Railroad yards and Highway 70 near Oroville. Following the start of the South Bay Aqueduct facilities in 1960, the first water delivery through the SWP was made in 1965. In 1963, work began on the California Aqueduct, and by 1968 the SWP was delivering water to long-term contractors in the San Joaquin Valley. The SWP delivered water to Lake Perris, its southernmost point, with the 1973 completion of its facilities.

SWP water was delivered to Napa County in 1968, through the first phase of the North Bay Aqueduct, and to Solano County in 1988, by the second phase. The first SWP water delivery through the Coastal Branch, Phase I into Kings and Kern Counties, was made in 1968. With completion of the Phase II facilities, water was delivered to San Luis Obispo and Santa Barbara Counties in 1997.

Even before completion of the initial facilities in 1973, work began in the early 1970s on building power plants and adding pumping units and turbine-generators deferred from the initial construction of the SWP; enlarging or extending aqueduct reaches; and providing facilities to ensure water quality in the Delta. In the 1990s, design and construction activities focused on repairing and replacing components of existing facilities, constructing the Devil Canyon Second Afterbay, constructing Phase II of the Coastal Branch to deliver water to San Luis Obispo and Santa Barbara Counties, and extending the SWP to the San Geronio Pass service area, which is scheduled to be completed in mid-2002.

Design Activities

Projects

DOE worked on 39 design projects in 1999.

Table 12-1 lists these projects along with expected or actual design completion dates (see tables at end of chapter). In addition to designing projects, the design staff conducted special deficiency studies of dams,

canal embankments, and other SWP facilities. Some of the studies and activities included

- Gap Dam exploration drilling
- Eastside Bypass levee foundation exploration drilling
- Perris Dam foundation exploration drilling
- backfilling of an observation well and slope indicator holes at Cedar Springs Dam
- developing drawdown criteria for San Luis Dam
- preparing plans and specifications for Grant Line Canal rubber dam alternative
- inspecting Willow Slough Bypass for preparation of a contract to raise the levees
- performing Gorman Creek flood studies
- assisting with the steady-state flow test on the East Branch
- studying and mapping of the breach inundation area for Castaic and Cedar Springs Dams
- preparing an inundation plan for Butte County
- evaluating hydrology and capacity of cross drainage facilities
- preparing a report on Antelope Dam spillway repair
- reviewing hydraulic studies of Hyatt Discharge Tunnel prepared by a consultant
- various other activities

Planning and Studies

DOE staff met with representatives of the U. S. Army Corps of Engineers to discuss the use of a soil bentonite slurry wall alternative for the American River levee system, the Arroyo Pasajero Gap Dam, and

other flood management activities and project operation matters.

DOE staff also completed the following studies:

- Castaic intake tower analysis
- conditions of radial gates at various SWP facilities
- inspection of all sites with CO₂ systems
- Delta HVAC equipment requirements
- Pyramid Dam bridge seismic retrofit
- Antelope Dam spillway
- Second Afterbay outlet structure modification
- modification of Chrisman Pumping Plant discharge valve hydraulic system
- conversion of As-Built Drawings to the Division of Operations and Maintenance AutoCAD system
- aqueduct spill basin surge analysis at Check 66
- continued studies and analysis of the Byron Bridge Road deterioration problem
- work on Federal Energy Regulatory Commission requirements as they pertain to operating the SWP

Construction Activities

DOE worked on 54 construction contracts in 1999. These are listed in Table 12-2. (See tables at end of chapter.) The table shows contract title, specification number, date the contractor received the notice to begin work, the expected or actual acceptance date, and the actual or estimated contract cost. Resolution of contract claims may extend the actual contract closeout beyond the actual completion date.

Tables 12-1 and 12-2 are organized geographically north to south according to construction divisions. Within each division, facilities where design or construction activities occurred are listed alphabetically, and activities at each facility are listed chronologically.

Oroville Division

Feather River Fish Hatchery. The contract to modify these facilities, which started in May 1998, was accepted in August 1999. Project features included constructing new rearing ponds, a hatchery building to include Americans with Disabilities Act modifications, a new ultraviolet disinfection building, demoli-

tion of selected existing facilities, and modifications to the Oroville Area Control Center.

Hyatt Power Plant and Thermalito Pumping-

Generating Plant. Work on a contract to refurbish turbine Units 1, 3, and 5 in Hyatt Power Plant started in February 1999 and is scheduled to be completed in March 2004. The work consists of

- designing, building, and testing a turbine model;
- designing, manufacturing, and installing new turbine runners, new wicket gates, facing plates, and appurtenances;
- furnishing spare parts and special tools; and
- providing erecting engineer and liaison services.

A contract to furnish governor replacements for Hyatt Power Plant and Thermalito Pumping-Generating Plant was started in November 1999 with completion scheduled for May 2001. The work consists of

- designing, manufacturing, testing and delivering digital governors, controls/auto-synchronizers, relay valve assemblies, spare parts, accessories, and special tools;
- providing erecting engineer and liaison services; and
- providing a training program.

Work on a contract to furnish automatic voltage regulators for Units 1 through 4 in Thermalito Pumping-Generating Plant was started in September 1998 and was completed in March 1999. The work under this contract consisted of

- furnishing a retrofit modification of the existing excitation and voltage regulating system;
- providing the services of an erecting engineer; and
- providing a training program.

Thermalito Diversion Dam. Work on a contract for fabricating, delivering, and installing 15 kV switch-gear at Thermalito Diversion Dam Power Plant was started in January 1999 and completed in September 1999.

Delta Facilities

South Delta. The contract to construct sets of two fish screens each for agriculture diversion to

Sherman Island at Horseshoe Bend on the Sacramento River, which started in July 1998, continued during 1999. Additional work was added by a contract change order that extended the completion date to May 2001.

Rock Barriers. Work on the multiyear (1998, 1999, and 2000) contract for construction of the seasonal temporary rock barriers in designated south Delta waterways (Middle River, Old River, and Grant Line Canal) continues. The installation and removal of barriers for 1999 were completed by December 1999.

These temporary rock barriers are installed to enhance water levels and circulation in the south Delta for local agricultural diversion, to assist fish migration, and to facilitate the gathering of hydraulic data for the design of future permanent barriers. Installation and removal is directed by Department personnel.

Suisun Marsh Facilities

Roaring River and Barker Slough. Work on a contract for levee restoration and site mitigation at Roaring River Slough Distribution System and Barker Slough Pumping Plant started in July 1999 and was completed in September 1999.

The work at Roaring River Slough consisted of raising levees and excavating for placement of geofoam block fill material, geotextile fabric, PVC geomembrane liner, aggregate base for levee road surface, and placement of stone slope protection.

The work at Barker Slough consisted of excavating and grading the mitigation area adjacent to Barker Slough, constructing drainage ditches, and disposing of excavated materials.

North San Joaquin Division

California Aqueduct. Work on canal repair, seepage, roads, concrete construction, and erection of facilities identification signs, which started in April 1998, was completed in February 1999.

South Bay Pumping Plant. Work on a contract for modifications at South Bay Pumping Plant was started in August 1999 and is scheduled for completion in March 2000. The work consists of

- furnishing and installing a new air conditioning system for the north service bay;
- relocating a hydraulic power unit;
- furnishing and installing pumping unit motor exhaust air ducts;
- removing an existing wall and constructing a new wall; and
- performing required electrical work.

South Bay Aqueduct. Contract work for removal of sediment and repair of the Santa Clara Terminal Facilities tank was started in February 1999 and completed in July 1999. The work consisted of

- removing and disposing of accumulated sediment from the terminal tank bottom;
- cleaning and repairing the interior of the tank;
- inspecting the tank bottom using magnetic flux exclusion technology;
- recoating the tank interior with high solid epoxy material; and
- installing high potential magnesium anode cathodic protection.

San Luis Division

California Aqueduct. Work on flood easement restoration and flood weirs started in July 1999 with an expected completion date in February 2000. The work consists of

- constructing compacted earth embankment from Harlan Avenue to Cerini Avenue adjacent to the California Aqueduct, mileposts 132 to 133;
- constructing a pump pad at milepost 132.8;
- raising the north Cantua Creek levee;
- constructing a gabion weir and removing sediment from an existing box inlet at milepost 133.7;
- constructing a concrete flume inlet transition and placing rock protection;
- constructing Salt Creek Weir and placing rock protection at milepost 135.8;
- furnishing and installing a 48-inch slide gate on an exiting inlet structure; and
- performing associated road work.

Coastal Branch

Phase I—Las Perillas and Badger Hill Pumping Plants. Contract work to furnish replacement switchgear and excitation systems in both Phase I plants,

which started in November 1994, was completed in April 1999.

Phase II—Pumping Plants. Work on the contract to furnish pump units for Devil's Den, Bluestone, and Polonio Pass Pumping Plants started in December 1993, with a projected acceptance date in March 2000. Although the pumps have been operational since August 1996, remedial warranty work was necessary and final operational testing was delayed. Units were accepted and the contract closed. The pumping plant completion contract that started in March 1995 was completed in May 1999.

Valves. Work to furnish ball valves for Phase II was started in April 1994 and was physically completed in August 1998, with acceptance expected in March 2000. The contract for designing, manufacturing, shop testing, and delivering butterfly valves of various sizes with actuators and control equipment, which started in July 1994, was physically completed in December 1999, with acceptance expected in March 2000.

Contract Administration. During 1999, coastal project staff continued the process of closing out completed contracts. Efforts continued to resolve outstanding potential and certified contract claims. Approximately 18 claims were settled during the year. At the end of 1999, only the claims for pipeline Reach 2 and pipeline Reaches 5a.1/5a.2 remain, with several issues still needing to be settled. The contractor filed for arbitration on November 4, 1998, on four outstanding issues. Coastal project staff continue working to resolve these issues.

South San Joaquin Division

Teerink Pumping Plant. Work on a contract to furnish spare coils and appurtenant materials, which started in August 1997, was completed in December 1999.

Tehachapi Division

Edmonston Pumping Plant. Work on the contract to furnish 15 kV circuit breakers for this facility, which started in April 1997, continues. The scheduled completion date was extended to June 2002 because more work was added to the original contract by change orders to include furnishing

15.8 kV circuit breakers for Gianelli Pumping-Generating Plant and Devil Canyon Power Plant.

West Branch

Angeles Tunnel. The contract to fabricate and furnish tunnel-gate stems for the Angeles Tunnel Intake Works, started in October 1997, was completed in June 1999.

Gorman Creek. The contract to restore Gorman Creek Bypass Channel was awarded in September 1997, but work was not started until June 1998 because of heavy El Niño rainstorms. The work was completed in May 1999. Additional work was added to the original contract by several contract change orders, including

- repairs to the existing Peace Valley Pipeline
- repairs to the Lower Quail Canal
- construction of a new 12-foot wide all-weather access road adjacent to the channel
- repairs to the bypass channel invert

Castaic Dam. Work on a contract to repair the Castaic Dam outlet tower access bridge, which started in November 1998, was completed in February 1999. A second contract to paint the tower bridge and crane was started in August 1999 and completed in December 1999.

Mojave Division

Mojave Siphon Power Plant. The contract to furnish and install turbines, generators, and governors, started in August 1989, is expected to be completed in February 2001. The contract to furnish acoustic flowmeters for the plant, started in October 1993, is expected to be completed in April 2000. A contract to construct valve vaults to furnish and install turbine shutoff valves for Units 1 and 2 at this facility started in April 1998 and was completed in July 1999.

Pearblossom Pumping Plant. The contract to manufacture, furnish, install, and test three 375 cubic feet per second vertical centrifugal pump units at Pearblossom Pumping Plant, started in May 1987, was completed in 1999. However, a large amount of remedial warranty work has to be performed before the units can be accepted.

California Aqueduct. The contract started in December 1998 to repair canal lining and operating roads from mileposts 305.10 to 305.44, mileposts 323.25 to 330.32, and mileposts 365.73 to 395.71 was completed in May 1999. A second contract to repair canal lining and culverts in pools 49 and 54 was started in September 1999 and was completed in December 1999. This second contract was completed in only a few weeks, with crews working 24 hours a day, to minimize outages.

Santa Ana Division

San Bernardino Tunnel Intake. The contract to reconstruct the San Bernardino Tunnel Intake Structure, started in July 1995, was completed in June 1999. Remedial warranty work on the gate hydraulic operating system had to be completed before the contract could be accepted.

Santa Ana Pipeline. Work on a contract to perform modifications and repairs to the Santa Ana Pipeline at milepost 433.06 started in October 1998 and is scheduled to be completed in June 2000. A second contract to perform repair work to Sugarloaf Mountain Road and drainage facilities started in September 1999 and is scheduled to be completed in May 2000.

Santa Ana Division—East Branch Enlargement

Devil Canyon Power Plant. Remedial warranty work by the turbine manufacturer was completed. Work on this contract started in July 1987 and is scheduled to be accepted in 2001.

A contract to perform site work required by FERC was started in September 1997 and completed in December 1999.

Santa Ana Division—East Branch Extension

Construction of Phase I of the East Branch Extension started with the issuance of a Notice to Begin Work on February 26, 1999, for pipeline Reaches 1 and 2. The project is being constructed to convey 8,650 acre-feet of SWP water annually to the San Gorgonio Pass Water Agency service area, with provisions to provide San Bernardino Valley Municipal Water District deliveries to the Yucaipa Valley. The conveyance facilities will consist of a combination of existing pipelines, three new pipeline reaches, three

new pump stations, and a new reservoir located in San Bernardino and Riverside Counties. The official groundbreaking ceremony for site work took place in Yucaipa on August 23, 1999. The following is a brief description of construction contracts already awarded and in progress.

Pump Stations. Work started in March 1999 on a contract to furnish power circuit breakers and switchyard equipment for Greenspot and Crafton Hills Pump Stations and is scheduled for completion in June 2001. A second contract to furnish power transformers for these facilities started in May 1999, with a scheduled completion date in August 2001.

Work started in October 1999 on a contract to design, manufacture, test, and deliver 5 kV switchgear for Greenspot and Crafton Hills Pump Stations. The contract also includes design, manufacture, testing, and delivery of programmable logic controllers for the Cherry Valley Pump Station. The completion date is scheduled for December 2001.

Work started in November 1999 on a contract to design, manufacture, shop test, and deliver three 4,500 gallons per minute and one 9,000 GPM vertical turbine pumps for Greenspot Pump Station, and two 4,500 GPM and one 9,000 GPM vertical turbine pumps for the Crafton Hills Pump Station. For Cherry Valley Pump Station, the contract calls for two 3,600 GPM vertical turbine pumps, as well as electric motors, appurtenant equipment, and associated training programs. Completion of this contract is scheduled for August 2001.

Pipeline Reaches. A contract for pipeline Reaches 1 and 2, which start at Mill Creek in San Bernardino County and extend through the cities of Yucaipa and Calimesa to Garden Air Creek in Riverside County, was awarded in February 1999, with expected completion in April 2001. The major features of the contract include

- 7-1/2 miles of 54-inch-diameter buried steel pipeline
- jacked road crossings
- excavation and backfilling
- asphalt pavement removal and replacement
- construction of reinforced concrete structures
- valves

- furnishing and installing fiber optic cable
- seeding restored ground areas

Valves. Three separate contracts were awarded to furnish different types of valves. Work started in October 1999 on a contract to furnish ANSI ball valves, with a scheduled completion date in June 2001. A contract to furnish AWWA butterfly valves started in October 1999, with completion scheduled for June 2001. A contract to furnish ANSI butterfly valves started in November 1999, with completion scheduled for June 2001. Change orders to each valve contract have delayed completion.

Construction Activities in Multiple Divisions

Power Plants. The contract to furnish butterfly valves for Mojave Siphon and Devil Canyon Power Plants, started in August 1991, is scheduled for completion in June 2002.

Storage Tank Removal. Work was completed in August 1999 on a contract to remove and replace underground storage tanks at Oroville, Delta, and San Luis Field Divisions.

Circuit Breakers and Coils. The contract to furnish 230 kV SF6 power circuit breakers for Banks and Edmonston Pumping Plants, started in March 1998, was completed and accepted in July 1999.

Work continues on a contract to furnish spare coils and associated materials for Pearblossom and Oso Pumping Plants. This work was started in March 1999 and is scheduled to be completed in April 2001.

Gantry Cranes. A contract to paint outdoor gantry cranes and an access bridge at Dos Amigos, Buena Vista, Teerink, Christman, Edmonston, Oso, and Pearblossom Pumping Plants, and Lake Perris started in July 1998 and was completed in January 1999.

Roads and Paved Areas. In August 1998 work started on a contract to apply an asphalt seal coat and asphalt slurry seal to the paved areas at the Oroville, Delta, San Luis, San Joaquin, and Southern Field Divisions. The completed contract was accepted in November 1999.

Work started in August 1999 on a contract to seal and pave roads at Oroville, Delta, San Luis, San Joaquin, and Southern Field Divisions and is scheduled to be completed in August 2000.

Site Revegetation. Work continues on a contract for revegetation of disturbed areas at Mojave Siphon Power Plant and Devil Canyon Second Afterbay. This work, which started in November 1999, fulfills FERC permit requirements and is scheduled to be completed in July 2001. The work consists of

- performing earthwork
- planting
- installing an irrigation system
- hydroseeding
- erosion control
- installing signs
- providing a 1-year plant maintenance and monitoring period

Miscellaneous Construction Activities

The following activities, although part of the SWP, are categorized as “miscellaneous.”

Oroville Wildlife Area. Work was started in September 1999 on a contract to construct an enlarged notch in a south levee of the Feather River system. The main part of the work was completed in December 1999, with other work scheduled for completion in October 2000.

Bethany Reservoir. A contract to dismantle and remove a Department-owned wind electrical energy-generating farm in the Bethany Reservoir area was started in May 1999 and completed in December 1999.

Colusa Bypass. In May 1999, work started on a contract to remove accumulated sediment from the Colusa Bypass. When work was completed in November 1999, approximately 2.2 million cubic yards of material had been removed and placed in adjacent spoil piles.

Environmental Activities

Environmental issues have concerned the Department since the inception of the SWP. These issues have increased in magnitude with the increased enactment of laws at both the federal and State level. To comply with these laws, the Department has incorporated them into its design and construction activities. A specific section dealing with environmental requirements has become part of the specification for construction contracts. Contracts being developed are reviewed carefully by the DOE environmental specialist to determine which of the requirements need to be included for each contract.

In addition to contracts that went out to construction, the environmental specialist oversaw work on the following projects during 1999:

- *Thermalito Diversion Dam, Radial Gate Rehabilitation*—completed without impacting nesting activities of migrating Cliff swallows (*Petrochelidon pyrrhanota*)
- *Reinforced Levee Notch, Oroville Wildlife Area*—proper disposal of debris encountered in an old burn dump by placing it in an encapsulated burial without disturbing a nearby nesting osprey (*Pandion haliaetus*)
- *Feather River Construction Debris Removal*—removal of old construction debris (in the 1960s) without working in the water, without disturbing vegetation, and while also preserving cultural and historical artifacts
- *Eastside Bypass Levee Raising*—raising of levees without disturbing endangered plant and animal species and revegetation of disturbed areas with appropriate seed mix
- *Revegetation of Mojave Siphon Power Plant and Devil Canyon Second Afterbay*—revegetation of disturbed areas with appropriate riparian vegetation
- *East Branch Extension*—required significant environmental documentation (i.e., environmental impact reports and supplemental EIRs) and extensive consultation with regulatory agencies to begin the project

Right of Way Activities

The Department has spent a net total of \$246.2 million to acquire rights of way and recreation and mitigation land for the SWP from its inception to December 31, 1999. From January 1 to December 31, 1999, the Department

- finalized acquisition of easement rights over two parcels (53.68-acre permanent easement and 26.74-acre temporary easement) for a total cost of \$307,509 for the Coastal Branch, Phase II Project;
- acquired property rights over 25 parcels (32.79-acre fee, 27.44-acre permanent easement, and 57.22-acre temporary easement) for a total cost of \$826,125 for the East Branch Extension, Phase II Project;
- acquired fee title to 5 acres for \$49,999 at the South Geysers facility to facilitate the sale of adjacent property and building;
- acquired a flowage easement (0.1 acre) for \$2,300 on East Branch, Mojave Division;
- acquired a road easement (0.35 acres) for \$500 on California Aqueduct, North San Joaquin Division;
- managed 88 leases for a total revenue of \$926,791;
- obtained 68 Temporary Entry Permits for the Westside Reservoir studies; 5 for Arroyo Pasa-jero studies; 6 for installation of CIMIS weather stations; 14 for East Branch Extension; 2 for Sugar Loaf Mountain; 20 for Delta monitoring well decommissioning; 1 for Delta water quality monitoring station; 7 for Delta barriers and studies; 1 for groundwater and slippage studies at South Bay Aqueduct terminal facilities; 3 for groundwater monitoring wells in Tehama County; 5 for Coastal Branch, Phase II; 1 for Orestimba Creek studies; 1 for Suisun Marsh studies; 1 for San Luis Reservoir studies;
- issued 22 encroachment permits and collected fees of \$45,880 for review and inspection costs;
- completed two encroachment reviews where the applicant had prior property rights;
- coordinated review of 16 tentative tract map developments within 1 mile of the Aqueduct; and,
- entered into six utility relocation agreements for the East Branch Extension.

Table 12-1
Design Activities, January 1, 1999, through December 31, 1999, by Division

<i>Construction Division and Facility</i>	<i>Construction Contract</i>	<i>Date Design Began</i>	<i>Design Estimated Completion Date</i>
Oroville Division			
Hyatt Power Plant	Furnish governor replacement, Units 1 through 6	May 1997	August 1999
	Ceiling replacement	June 1998	July 1999
	Renovate electrical controls for intake gate and gantry cranes	March 1999	January 2000
Lake Oroville	Lime Saddle Campground	January 1999	January 2000
Oroville Diversion Dam	Radial gate rehabilitation	April 1999	February 2000
Oroville Wildlife Area	Reinforced levee notch	December 1997	March 1999
Thermalito Diversion Dam and Oroville Dam Spillway	Stop-log fabrication/rehabilitation	July 1999	October 1999
Suisun Marsh Facilities			
Roaring River Slough Distribution System	Levee restoration and site mitigation	February 1999	April 1999
<i>North Bay Aqueduct</i>			
Cordelia Pumping Plant	Sediment removal, forebay	October 1999	November 1999
<i>South Bay Aqueduct</i>			
South Bay Pumping Plant	Plant modifications	February 1998	April 1999
North San Joaquin Division			
Banks Pumping Plant	Automatic voltage regulators, Units 1 through 7	October 1998	New schedule pending
Bethany Reservoir	Dismantle and remove wind farm	March 1999	April 1999
Clifton Court Forebay	Trash rake replacement	March 1998	October 1999
San Luis Division			
California Aqueduct	Flood easement restoration and flood weir mileposts 81, 135, and 136	November 1998	April 1999
Coastal Branch			
Badger Hill Pumping Plant	Pump refurbishment	October 1998	April 1999
Mojave Division			
California Aqueduct	Repair canal lining and culvert, mileposts 320 to 350	April 1999	September 1999
Santa Ana Division			
<i>East Branch Extension</i>			
	Crafton Hills Reservoir, Yucaipa	May 1997	March 2000
	Greenspot, Crafton Hills, and Cherry Valley Pump Stations	May 1997	December 1999
	Pipeline Reach 3, Garden Air Creek to Noble Creek	May 1997	February 2000
	Furnish ANSI ball valves	July 1997	October 1999
	Furnish ANSI butterfly valves	July 1997	November 1999

Table 12-1 (Continued)
Design Activities, January 1, 1999, through December 31, 1999, by Division

<i>Construction Division and Facility</i>	<i>Construction Contract</i>	<i>Date Design Began</i>	<i>Design Estimated Completion Date</i>
	Furnish AWWA butterfly valves	July 1997	October 1999
	Furnish pumps, motors, and variable frequency drives—Greenspot, Crafton Hills, and Cherry Valley Pump Stations	July 1997	November 1999
	Furnish 5 kV switchgear—Greenspot, Crafton Hills, and Cherry Valley Pump Stations	September 1997	October 1999
	Furnish circuit breakers—Greenspot and Crafton Hills Pump Stations	December 1997	March 1998
	Furnish power transformers, Greenspot and Crafton Hills Pump Stations	December 1997	May 1998
	Furnish and install control and communications system	January 1998	New Schedule Pending
	Valve vaults, Morton Canyon and Carter Street	November 1998	April 2000
	Install fiber optic cable—Greenspot Pump Station to Crafton Hills Pump Station	June 1999	April 2000
Santa Ana Pipeline	Sugarloaf Mountain road repair and drainage repair	July 1998	February 1999
<i>West Branch</i>			
Castaic Dam	Recoating Castaic tower access bridge and jib crane	February 1999	May 1999
Castaic Lake	Recreation facilities renovation—east ramp area	October 1998	November 1999
Operations Center Relocation	Building and site work	May 1998	April 1999
Oso Pumping Plant	Furnish automatic voltage regulators and excitation equipment	January 1999	October 1999
Pyramid Dam	Bridge seismic modifications and spillway repair	February 1999	December 1999
Multiple Divisions			
Banks Pumping Plant and Gianelli Pumping-Generating Plant	Furnish spare coils and materials	July 1999	January 2000
San Luis and San Joaquin Field Divisions	Stair addition, ADA modifications, and atrium enclosure	May 1998	October 1999
State Water Project	Seal and pave roads	March 1999	May 1999
Miscellaneous			
Merced River	Salmon habitat restoration	December 1998	February 1999

Table 12-2
Construction Activities, January 1, 1999, through December 31, 1999

<i>Construction Division and Facility</i>	<i>Construction Contract (Specification Number)</i>	<i>Starting Date (NTBW)</i>	<i>Acceptance Date (Expected or Actual)</i>	<i>Contract Costs (Thousands of dollars)</i>
Oroville Division				
Feather River Fish Hatchery and Oroville Area Control Center	Expand hatchery and perform ADA modification (97-24)	May 1998	August 1999	1,856
Hyatt Power Plant	Turbine refurbishment, Units 1, 3, and 5 (98-22)	February 1999	March 2004	10,150
Hyatt Power Plant and Thermalito Pumping-Generating Plant	Furnish governor replacement (99-19)	November 1999	May 2001	1,570
Thermalito Pumping-Generating Plant	Furnish automatic voltage regulators, Units 1 through 4 (98-12)	September 1998	December 2000	464
Thermalito Diversion Dam	Furnish and install 15 kV switchgear (98-17)	January 1999	November 1999	220
Delta Facilities				
Sherman Island	Construct fish screens (98-07)	July 1998	May 2001	2,860
Temporary Rock Barriers	Construct temporary rock barriers—1998 and 1999—Middle River, Old River, and Grant Line Canal (97-23)	January 1998	December 2000	3,734
Suisun Marsh Facilities				
Barker Slough Pumping Plant and Roaring River Slough	Restore levee and mitigate site (99-11)	July 1999	December 1999	1,792
North San Joaquin Division				
California Aqueduct	Repair canal, seepage, roads, concrete, and erect monument signs (98-04)	April 1998	February 1999	2,196
South Bay Pumping Plant	Modify plant (99-02)	August 1999	March 2000	207
South Bay Aqueduct	Remove sediment and repair tank, Santa Clara Terminal Facilities (99-01)	February 1999	July 1999	926
San Luis Division				
California Aqueduct	Construct flood weirs and restore flood easement (99-08)	July 1999	February 2000	1,140
Coastal Branch				
<i>Phase I</i>				
Las Perillas and Badger Hill Pumping Plants	Furnish replacement switchgear and excitation system (94-28)	November 1994	April 1999	573
<i>Phase II</i>				
Devil's Den, Bluestone, and Polonio Pass Pumping Plants	Furnish pump units (93-25)	December 1993	March 2000	4,070
	Complete pumping plants (93-31)	March 1995	May 1999	17,503
Valves	Furnish ball valves (93-34)	April 1994	March 2000	4,622
	Furnish butterfly valves and turbine bypass valve, Devil's Den Pumping Plant to Vandenberg AFB (94-06)	July 1994	March 2000	4,581
South San Joaquin Division				
Teerink Pumping Plant	Furnish spare coils and materials (97-02)	August 1997	February 2000	175
Tehachapi Division				
Edmonston Pumping Plant	Furnish 15 kV circuit breakers (97-01)	April 1997	June 2002	10,792

Table 12-2 (Continued)
Construction Activities, January 1, 1999, through December 31, 1999

<i>Construction Division and Facility</i>	<i>Construction Contract (Specification Number)</i>	<i>Starting Date (NTBW)</i>	<i>Acceptance Date (Expected or Actual)</i>	<i>Contract Costs (Thousands of dollars)</i>
<i>West Branch</i>				
Angeles Tunnel	Furnish intake gate stems, Angeles Tunnel intake works (97-07)	October 1997	June 1999	721
Gorman Creek Bypass Channel	Restore channel and emergency repairs at Peace Valley pipeline and lower Quail Canal (97-13)	September 1997	September 1999	7,557
Castaic Dam	Repair outlet tower access bridge (98-19)	November 1998	February 1999	303
	Recoat tower bridge and crane (99-12)	August 1999	December 1999	138
Mojave Division				
Mojave Siphon Power Plant	Furnish and install turbines, generators, and governors (89-13)	August 1989	February 2001	14,750
	Furnish and install acoustic velocity flowmeters (93-18)	October 1993	August 2000	437
	Construct valve vaults (97-25)	April 1998	June 2001	3,116
Pearblossom Pumping Plant	Furnish and install vertical centrifugal pumps (87-04)	May 1987	June 2001	2,571
California Aqueduct	Repair canal lining and roads—mileposts 305.10 to 305.44, mileposts 323.25 to 330.32, and mileposts 365.73 to 395.71 (98-25)	December 1998	June 1999	4,234
	Repair canal lining and culvert—mileposts 320 to 350 (99-29)	September 1999	August 2000	4,036
Santa Ana Division				
San Bernardino Tunnel Intake	Reconstruct intake structure (95-07)	July 1995	December 2001	25,531
Santa Ana Pipeline	Modify pipeline—milepost 433.06 (98-20)	October 1998	June 2001	1,400
	Repair Sugarloaf Mountain Road and drainage (99-18)	September 1999	May 2000	252
<i>East Branch Enlargement</i>				
Devil Canyon Power Plant	Furnish and install turbines, governors, and valves (87-15)	July 1987	January 2001	11,065
	Site work (96-20)	September 1997	December 1999	3,342
<i>East Branch Extension-Phase I</i>				
Greenspot and Crafton Hills Pump Stations	Furnish power circuit breakers and switchgear equipment (98-16)	March 1999	June 2001	300
	Furnish power transformers (98-18)	May 1999	August 2001	660
Greenspot, Crafton Hills, and Cherry Valley Pump Stations	Furnish 5 kV switchgear and furnish PLC cubicle, Cherry Valley Pump Station (99-15)	October 1999	December 2001	628
	Furnish pumps, motors, and variable frequency drives (99-17)	November 1999	August 2001	3,111
Pipeline Reaches	Construct pipeline Reaches 1 and 2—Mill Creek to Garden Air Creek (98-24)	February 1999	April 2001	20,649

Land and Right of Way.

Chapter 13

Recreation

Picnic area at Lake Del Valle

Significant Events

- The groundbreaking celebration for the Arroyo Del Valle Youth Camp and Environmental Education Center took place on May 21, 1999. The event was co-sponsored by East Bay Regional Park District, Alameda County Office of Education, Camp Open Arms, and the Taylor Family Foundation.
- Among those participating in the groundbreaking ceremony were California State Senators Liz Figueroa and Richard Rainey, and State Assem-

bly Members Lynne Leach and John Dutra. They were joined by Elaine Taylor of the Taylor Family Foundation, who spearheaded the project. Construction and implementation of the facility will occur in phases with Camp Arroyo Phase One scheduled for completion in spring 2001. The facility will include an energy-efficient operating system. The site is located at the west end of Lake Del Valle on 138 acres of land owned by EBRPD.

The State Water Project, a multipurpose project, benefits millions of Californians. In addition to providing water supply, flood control, and habitat for fish and wildlife, the SWP offers extensive and varied recreational opportunities—tours, sightseeing, fishing, hunting, camping, boating, water skiing, bicycling, and swimming.¹

Recreation Areas

The SWP has 37 developed recreation areas or sites throughout California, including 18 fishing access sites. Figure 13-1 shows the names and locations of each area.

Recreation Days

In 1999, SWP facilities received 4.11 million recreation days of use (Table 13-1), a slight decrease from the 4.20 million recreation days recorded in 1998. Recreational use at the 18 developed fishing access sites and along the California Aqueduct Bikeway nearly equaled that of 1998. A recreation day is defined as one individual user visiting a recreation site along the SWP during a 1-day period.

Most SWP recreation and visitor use was concentrated at the major reservoirs, where well-developed facilities accommodate the public. Fifty-one percent of the total SWP recreational use in 1999 occurred at the four major reservoirs in Southern California: Pyramid Lake, Castaic Lake, Silverwood Lake, and Lake Perris.

Since the SWP began delivering water in 1962, more than 155 million recreation days have been recorded at SWP recreational facilities.

¹ According to the Davis-Dolwig Act (Water Code Sections 11925 *et seq.*), the Department has overall responsibility to acquire property, plan recreation, and ensure that enhancement of fish and wildlife habitat is included as part of the State Water Project, although the costs of these recreation activities are not borne by the water supply contractors. In addition, Federal Energy Regulatory Commission License Numbers 2100 and 2426 require the Department to plan for recreational and associated activities at licensed SWP facilities.

Facilities

Planning

During 1999, the Department of Boating and Waterways completed plans for the following projects:

- boat launching facility improvements at Medeiros area at San Luis Reservoir State Recreation area;
- improvements at Pyramid Lake Emigrant Landing area;
- Castaic Dam left abutment launch ramps; and
- shoreline improvements at the Sawpit Canyon area at Silverwood Lake.

New Facilities

Lake Davis. Boarding floats and anchors were installed by DBW at the following locations:

- Honker Cove
- Lightning Tree
- Camp 5 areas

Lake Oroville. The following activities were also completed:

- DBW paved the launch ramp and access road from Larkin Road and installed a boarding float at Thermalito Afterbay area.
- DBW installed a fuel guard at Lime Saddle Boat Ramp.
- Restrooms and a car-top launch for non-motorized boats were provided at the Diversion Pool area.

77th Street East	100
Longview Road	100
California Aqueduct:	
Walk-In Fishing	2,600
Bikeway	500
<i>Subtotal</i>	<i>2,111,200</i>
Total	4,108,900

Improvements to Facilities

The following improvements were made at Lake Oroville during 1999 to help meet recreational demands.

- A cross link of the bike trail was completed, providing a shortcut in the vicinity of the power canal and the fish hatchery.
- Improvements to traffic flow in the parking areas were made at the Monument Hill area of Thermalito Afterbay.
- Beach sand was replaced at the North Thermalito Forebay area.

At Lake Del Valle a \$1.2 million DBW-funded project was completed that includes new public restrooms, a shade structure, new landscaping, a fish cleaning table, a new boarding dock for boats, and a repaved road. In the campground area, 28 toilets were replaced with low-flow facilities.

Oroville Recreation Plan

On October 1, 1992, the Federal Energy Regulatory Commission issued Order 2100-052, which required the Department to prepare a revised recreation plan for Lake Oroville. This plan replaced the original *Oroville Reservoir, Thermalito Forebay, and Afterbay Recreation Report* (Bulletin 117-6), which was prepared in December 1966. Another new plan, in FERC Order 2100-054, submitted June 1, 1993, and approved September 22, 1994, includes additional recreation facilities and addresses concerns raised by local residents regarding recreation and fishery-related issues.

Implementation of the recreation plan began in 1995 with establishment of the Lake Oroville Recreation Advisory Committee. This committee, comprised of local government, citizens' groups, and State agencies, was formed to advise the Department on recreation plan implementation. The following elements are being developed or are already completed.

- Ten floating campsites were constructed and moored at various locations on the lake.
- An en route RV camping area was added at the North Forebay area.
- Construction began on a duck brood pond and restroom and picnic facilities at Thermalito Afterbay.
- Buoys were deployed around the water-ski slalom course.

- Construction was completed on the 41-mile bike trail main loop.
- Construction was completed on the Lime Saddle Boat Ramp improvements (DBW), an equestrian campground at Loafer Creek Recreation area, and lighting on Oroville Dam.
- Fishery and fishing improvements included development of a fish management and stocking plan, stocking chinook salmon, and development of fish shelters.

Most recreation and fish facilities were completed by 1999; certain elements of the plan may require time extensions to complete.

Fish Plantings

In 1999, the Department of Fish and Game continued its fish-planting activities at 12 SWP facilities. Total plantings of trout and chinook salmon decreased by nearly 45 percent in 1999 (Table 13-2).

At the Feather River Fish Hatchery and the Thermalito Afterbay rearing ponds, 10,690,700 fish were produced in 1999, up 3 percent from 1998. This includes 10,253,300 chinook salmon and 437,400 steelhead trout. Of the chinook salmon reared, 1,751,100 were fingerlings, 7,988,500 were advanced fingerlings, 376,800 were subcatchables, and 136,900 were catchables. Of the steelhead reared, all were yearlings.

Recreation Financing

Recreational facilities are financed in accordance with several legislative provisions, specifically, the Davis-Dolwig Act (Water Code Sections 11925 *et seq.*), Assembly Bill 12 (Water Code Sections 11912, 11915, and 11915.1), and the Environmental Water Act, Assembly bills 1441 and 1442 (Water Code Sections 12929 *et seq.*).

The Davis-Dolwig Act declared that providing for the enhancement of fish and wildlife and for recreation in connection with State water projects benefits all the people of California and that the costs attributable to such enhancement should be borne by them. The act also provided a procedure where the State's General Fund would reimburse the Department for those project costs allocated to recreation and fish and wildlife enhancement and for costs of acquiring property for recreation development.

The reimbursements were included in the Department's budget as appropriations from the General Fund and are used by the Department to pay for operations, maintenance, power, and replacement costs associated with operating the SWP for fish and wildlife enhancement and recreation.

Assembly Bill 12 provides for a \$5-million annual appropriation from tideland oil and gas revenues to fund joint capital costs of State water projects allocated to recreation, enhancement of fish and wildlife, and purchases of land for recreational uses. Through the 1985-86 fiscal year, the Department received \$90 million from tideland oil and gas revenues for this funding.

Assembly Bill 1442, known as the "Offset Legislation," offsets monies owed the California Water Fund by the SWP with reimbursements owed the project by the General Fund under the Davis-Dolwig Act. Monies owed the California Water Fund by the SWP were fully offset in 1998.

Appendix D to Bulletin 132, *Costs of Recreation and Fish and Wildlife Enhancement*, contains specific information about capital costs allocated to fish and wildlife enhancement and recreational enhancement and recreational development. This report to the Legislature is published annually by the Department.

Table 13-2
Fish Planted in 1999
 (Thousands)

<i>Location and Size</i>	<i>Eagle Lake Trout</i>	<i>Brook Trout</i>	<i>Rainbow Trout</i>	<i>Brown Trout</i>	<i>Chinook Salmon</i>	<i>Total</i>

Information for this chapter was provided by the Division of Planning and Local Assistance, Central District, the Office of Water Education, and the State Water Project Analysis Office.

Chapter 14

Financial Analysis

Construction of the East Branch Extension, Reach 1,
financed by water revenue bonds

Significant Events

- In July 1999, the Department implemented Phase I of the Systems Application Products program. SAP is an integrated software system used to run the various business functions of the

Department. The SAP system provides most of the accounting and financing data required for financial analysis.

This chapter presents both a summary and a detailed explanation of State Water Project current financial analysis, capital costs and requirements, revenues and expenses, and bond activities for years 2000 through 2015.

The Department performs a financial analysis annually to ensure that the SWP financing program will have sufficient funds to meet construction obligations; project operation, maintenance, power, and replacement costs; and bond debt service payments expended for construction. The results of the current financial analysis, dated December 31, 1999, are presented in Tables 14-1 and 14-2 on pages 187 and 188.

Future conditions may change the financial analysis. These contingencies include

- alterations in schedules of currently planned construction for future facilities;
- changes in economic conditions, including changes in interest rates and in SWP contractor entitlements due to changes in amounts of water needed, conserved, or reclaimed;
- completion of Delta transfer facilities;
- development of additional sources of water not foreseen at this time;
- deviations from the assumptions regarding actual rates of price escalations for future construction from those currently assumed for cost estimates;
- increases in capital costs related to additional conservation facilities; and
- outcomes of lawsuits now pending before the courts.

Capital Requirements and Financing

In conducting the current analysis, the Department projected that future construction and Davis-Grunsky Act Program costs through the year 2015 will total \$378 million. Special capital requirements for revenue bond financing of these construction costs are

projected at \$25 million for a total capital requirement of \$403 million. This projection includes construction and financing costs for the following significant SWP facilities planned for completion by 2015:

- Interim South Delta facilities
- Gorman Creek Channel modifications on the West Branch of the California Aqueduct
- Extension of the East Branch of the California Aqueduct

Most of these capital requirements will be financed from the projected sale of \$200 million of revenue bonds. The remaining \$203 million will be financed from current bond proceeds, capital resources revenues, and the transfer of excess revenues not needed for operation costs or debt service.

The analysis of capital requirements and financing presented in Table 14-1 does not include the costs and financing of all facilities needed to develop the remaining yield necessary to meet the total 4.2 million acre-feet contractual commitment to long-term SWP water contractors. Also, Table 14-1 does not include costs of associated work essential for realizing full benefits from the SWP but financed and constructed by local interests or State agencies other than the Department. Those facilities include on-shore recreational developments at SWP facilities and local distribution facilities.

The allocation of capital expenditures among various SWP purposes is detailed in Table 14-3.

Table 14-3
Allocation of Capital Expenditures
(Thousands of Dollars)

Facilities and Construction Divisions	Expenditures Incurred Through 1999	Future Expenditures	Total	Preliminary Allocation Among Project Purposes			
				Water Supply and Power Generation	Flood Control ^a	Recreation and Fish and Wildlife Enhancement	Other ^b

^a Reflects the Department's allocation to this purpose, irrespective of federal payments.

^b Includes costs currently unassigned to purpose, planning costs of deleted features of project facilities, initial costs of inventoried items, joint costs assigned to the federal government, and costs assigned to the Davis-Grunsky Act Program.

Capital Requirements

Lines 1 through 19 in Table 14-1 show actual and projected SWP capital requirements through 2015. Estimates of future capital expenditures include allowances for construction costs escalation of 3 percent per year from 2000 through 2001 and 4 percent per year from 2002 through 2015. Right-of-way costs are escalated at 4 percent per year from 2000 through 2015. Capital expenditures for the SWP also include requirements other than those for construction, such as disbursements made as part of the Davis-Grunsky Act Program (Line 15) and special capital requirements under revenue bond financing (Line 16). The Department will decide to construct facilities only after examining alternatives and completing environmental documentation and other review processes.

Line 1, Initial Project Facilities, includes only those facilities completed before 1974 (see Bulletin 132-74, Chapter 2). Additional costs after 1973 and estimated costs of remaining work on the initial SWP facilities are not included.

Line 2, North Bay Aqueduct, Phase II, consists of pipelines, pumping plants, and a small reservoir necessary to divert water from the western Delta to Napa and Solano Counties for urban use. Phase II is connected with the Phase I facilities which were completed in 1968 (Phase I costs are included in the initial project facilities discussed in Line 1). Phase II became operational in May 1988.

Line 3, Delta and Suisun Marsh Facilities, shows historical costs in Column 1 that include planning costs for general Delta facilities and historical costs associated with the previously planned peripheral canal and overland water delivery facilities for the western Delta.

Also included are historical planning costs for Suisun Marsh as well as construction costs for the Suisun Marsh Salinity Control Gates and an access road. The projected amounts include projected planning costs plus projected costs for constructing four permanent barriers in the Delta and an additional intake at Clifton Court Forebay.

Line 4, Final Four Units at Banks Pumping Plant, includes costs of the final four 1,067-cfs units, which

became operational in spring 1992, and final payments for plant equipment.

Line 5, Coastal Branch Aqueduct, Phase II, includes all costs for the planning, design, and construction of Phase II of the Coastal Branch of the California Aqueduct. Phase II construction began in October 1993 and was completed in 1997. Water deliveries from Phase II facilities began in July 1997. Future costs in this line are the estimated costs for settlement of outstanding construction claims.

Line 6, West Branch Aqueduct, shows costs for all facilities on the West Branch except Warne Power Plant. Warne Power Plant costs are included in Line 10.

Line 7, East Branch Enlargement, includes expenditures for first-stage construction of the East Branch Enlargement, including the enlargement share of power plant costs at Mojave Siphon and Devil Canyon. (The remaining power plant costs are included in Line 10.) East Branch Enlargement costs by facility are presented in Table 14-4. Costs for Alamo Power Plant consist of expenditures for Unit 1 facilities allocated to enlargement. Construction of Unit 2 has been deferred.

All costs in Line 7 are allocated to and repaid by the seven Southern California contractors participating in the East Branch Enlargement.

Line 8, East Branch Improvements, shows all aqueduct costs on the East Branch not allocated to the enlargement project. Those costs include improvements constructed concurrently with the enlargement work and the reconstruction of the San Bernardino Tunnel Intake. Costs for power plant construction at Alamo, Mojave Siphon, and Devil Canyon are not included in this line.

Line 9, East Branch Extension, shows expenditures for Phase I of the extension of the East Branch of the California Aqueduct. The East Branch Extension will extend the California Aqueduct east from the Devil Canyon Power Plant to a terminus at Noble Creek near Beaumont in Riverside County. The extension will provide water service to the San Geronio Pass Water Agency and the San Bernardino Valley Municipal Water District. Construction began in October

1998 and is scheduled for completion in 2002. All costs in Line 9 will be allocated to and repaid by the two participating contractors.

Line 10, Power Generation and Transmission Facilities, does not include the East Branch Enlargement share of costs for Alamo, Mojave Siphon, and Devil Canyon Power Plants shown in Line 7 of Table 14-1. Estimated capital costs for facilities included in Line 10 are shown in Table 14-5.

Line 11, Additional Conservation Facilities, shows projected costs to plan and study additional conservation facilities. Specific planning activities and projected spending amounts for 2000 through 2015 are shown in Table 14-6. Expenditures for these items are being reviewed. Construction costs of additional conservation facilities are not included in the financial analysis.

Line 11 does not include CALFED program costs. CALFED expenditures for preliminary planning and environmental impact report preparation are currently financed by appropriations from the General Fund. The Department assumes that future costs of the CALFED program will continue to be financed from the General Fund.

Line 12, San Joaquin Drainage Facilities, includes projected costs of the San Joaquin Valley Drainage Monitoring Program. The activities in this program are monitoring, evaluating, reducing, and treating drainage, and investigating evaporation ponds.

The Department assumes that future costs of the drainage program will be financed by revenue transfers (Line 31).

Line 13, Other Costs, includes items such as general design and construction costs, costs of completing operation and maintenance facilities, and costs of other completion activities for the initial facilities of the California Aqueduct. Portions of those costs ultimately will be allocated to aqueduct units described in the preceding paragraphs.

Line 14, Total Project Construction Expenditures, is the total of Lines 1 through 13.

Line 15, Davis-Grunsky Act Program Costs, shows costs of the Davis-Grunsky Act Program, a financial assistance program to provide grants and loans to public agencies for constructing local water projects.

As of December 31, 1999, the Department had disbursed \$129 million (including \$8.5 million for administration) in grants and loans for local agencies throughout the State.

Line 16, Special Capital Requirements under Revenue Bond Financing, presents special capital requirements at the time revenue bonds are sold. The financial analysis assumes that proceeds from any future revenue bonds will be used to pay for bond discounts, bond issuance costs, and debt service reserve requirements.

Information about the application of proceeds to these special requirements for actual and assumed revenue bond sales is presented in Table 14-7.

Line 17, Total Capital Requirements, is the total of Lines 14, 15, and 16.

Line 18, Power Facilities Capital Requirements, shows the total capital requirements for power facilities included in Line 17.

Line 19, Water Facilities Capital Requirements, shows the total capital requirements for water facilities included in Line 17.

Capital Financing

The SWP was constructed with three general types of financing: Burns-Porter, revenue bonds, and capital resources. Lines 20 through 33 of Table 14-1 present specific information about those sources of financing.

Burns-Porter Act. Burns-Porter financing is derived from the sale of California Water Resources Development Bonds (general obligation bonds) and State Tideland Oil Revenues deposited in the California Water Fund as authorized by the Burns-Porter Act (Water Code sections 12930-12944), approved by voters in November 1960. The Burns-Porter Act authorized an issue of \$1.75 billion of general obligation bonds of the State, which are repaid by revenues

^a Actual bond issue for all except future water system facilities and future East Branch Enlargement bonds.
^b Bond financing and refunding costs include funds applied to debt service reserve requirements.
^c Includes \$2,215 million of refunded principal, leaving a net principal obligation of \$3,377 million.

received according to the water supply contracts. Of that authorization, \$130 million have been reserved specifically for the Davis-Grunsky Act Program.

Proceeds from the sale of general obligation bonds are deposited in the California Water Resources Development Bond Fund-Bond Proceeds Account, from which monies may be expended only for the construction of SWP facilities and for the Davis-Grunsky Act Program. Approximately 30 percent of the expenditures through 1999 for construction and the Davis-Grunsky Act Program were financed with general obligation bonds.

Monies deposited in the California Water Fund were appropriated for purposes outlined in the Burns-Porter Act. Such deposits were derived from a portion of the State Tideland Oil Revenues according to a continuing authorization. The California Water Fund was used to finance \$508 million or approximately 10 percent of the construction expenditures through 1999.

Revenue Bonds. Revenue bond financing is derived from the sale of revenue bonds as authorized by the Central Valley Project Act (California Water Code sections 11100-11925). The Department's authority to issue revenue bonds was confirmed by a decision of the California Supreme Court in 1963 (*Warne v. Harkness*, 60 Cal. 2d 579).

Proceeds from the sale of revenue bonds are deposited in the Central Valley Water Project Construction Fund, from which money is expended only for purposes specified in the resolution authorizing each bond sale. Those purposes, in addition to paying construction, planning, and right-of-way costs, may include funding the Debt Service Reserve Account, paying interest on bonds, and paying water system operating expenses during a specified period.

As of December 31, 1999, the Department had sold \$5.4 billion of revenue bonds. That amount includes \$2.4 billion of refunded bonds, leaving a total principal obligation of \$3.0 billion.

Capital Resources. Capital resources financing is derived from payments and appropriations (including a portion of Tideland Oil Revenues) authorized by a

variety of special contracts, cost-sharing agreements, and legislative actions concerning the SWP, plus accrued interest on these funds.

Capital resources revenues are deposited in the Central Valley Water Project Construction Fund and may be expended for interest on general obligation bonds and costs of constructing SWP facilities.

According to the Department's financial management policy, the capital resources revenues are used first to cover any general obligation bond debt service that exceeds available revenues.

Capital Financing Sources

Capital financing sources include power revenue bonds, East Branch Enlargement bonds, East Branch Extension bonds, water system facilities bonds, initial project facilities bonds, proceeds from the Davis-Grunsky Act, California Water Fund monies, and capital resources revenues.

Line 20, Power Revenue Bonds through Series H, includes the proceeds applied from power revenue bonds for the Oroville, Devil Canyon, Castaic, Warne, Reid Gardner, Bottle Rock, Alamo, South Geysers, and small hydro projects.

No future power revenue bond sales are projected for the financial analysis.

Line 21, East Branch Enlargement, Current Bonds, shows that \$485 million of Water System Revenue Bond proceeds have been applied to the East Branch Enlargement project through December 31, 1999. Of this total amount, \$418 million were used for construction expenditures and \$67 million for bond discounts, interest costs, and debt service reserves.

No future East Branch Enlargement revenue bond sales are projected for the financial analysis.

Line 22, East Branch Extension, Current Bonds, shows that \$60 million of Water System Revenue Bond proceeds were available for the East Branch Extension project. Of this total, \$20.9 million had been spent through December 31, 1999. The remaining \$39.1 million will be used to pay future construction costs.

Line 23, East Branch Extension, Future Bonds, shows the Department's estimate of additional bonds required to complete construction of the East Branch Extension and to pay for bond discounts, capitalized interest, and debt service reserve requirements.

Line 24, Water System Facilities, Current Bonds, shows that through December 31, 1999, \$1.4 billion of proceeds from Water System Revenue Bonds, Series A through Series V, were applied to SWP projects other than the East Branch Enlargement and the East Branch Extension. Of this total amount, \$1.2 billion were used to pay for construction expenditures and \$0.2 billion to pay for bond discounts, capitalized interest, and debt service reserve requirements.

Line 25, Water System Facilities, Future Bonds, shows that future water revenue bonds are needed to provide \$132 million for construction of SWP water system facilities and \$18 million for bond discounts, interest costs, and debt service reserve requirements.

Line 26, Subtotal, Water Revenue Bonds, is the total of Lines 21 through 25.

Line 27, Initial Project Facilities Bond Proceeds, shows the amount of general obligation bonds sold to provide initial financing costs for SWP facilities and for costs of planning certain additional conservation facilities.

Financing initial facilities from general obligation bonds was completed in mid-1972 and totaled \$1.444 billion—\$1.750 billion Burns-Porter Act authorization less \$130 million reserved for the Davis-Grunsky Act Program and \$176 million “offset” for additional conservation facilities. (The Burns-Porter Act provides that to the extent California Water Fund monies are expended, an equal amount of general obligation bonds are reserved [offset] for financing the construction of additional conservation facilities in certain watersheds.)

In mid-1972, the reservation of offset bonds was effectively limited to \$176 million, the total amount of California Water Fund monies expended up to that time. By mid-1972, all general obligation bonds authorized by the Burns-Porter Act had been offset,

reserved for the Davis-Grunsky Act Program, or used for SWP construction.

Approximately \$8.5 million of the offset bonds were used to finance planning studies of the Middle Fork Eel River Development. This financial analysis is not based on the use of any offset bond proceeds to meet capital requirements. If, at some time, the State constructs an additional conservation facility, as specified in Water Code Section 12938, the remaining offset bonds could be sold.

Line 28, Davis-Grunsky Act Program Bond Proceeds, shows, for simplification, the entire \$130 million of capital expenditures authorized for the Davis-Grunsky Act Program according to the Burns-Porter Act as being funded by proceeds from the sale of general obligation bonds. In fact, \$28 million from the California Water Fund was used for the program in lieu of bond proceeds prior to 1969.

In making the financial analysis, the Department assumes that all authorized Davis-Grunsky bonds will be sold before 2001.

Line 29, Application of California Water Fund Monies, shows the amount of SWP costs financed under the Burns-Porter Act. The Act provides that any available money in the California Water Fund must be used for construction in lieu of proceeds from the sale of general obligation bonds.

When the Burns-Porter Act became effective in late 1960, approximately \$97 million had been accumulated in the fund. That balance plus subsequent appropriations, interest earnings, and other miscellaneous income to the fund through December 31, 1999, was used to finance a total of \$508 million of SWP costs.

Line 30, Interim Financing, shows the net annual amounts of funds flowing into and out of the Water Revenue Commercial Paper Notes program. The note program was established in March 1993 to provide an ongoing source of interim financing for Water System Projects prior to permanent financing from the sale of long-term revenue bonds. The Department has authority to issue up to \$94.4 million of Water Revenue Commercial Paper Notes. A positive number indicates money borrowed from the

program to finance construction costs. A negative number indicates money repaid into the program. The financial analysis assumes that all funds borrowed from the program will be repaid before the end of the analysis period.

Line 31, Application of Capital Resources Revenues to Construction, presents the Capital Resources Revenues applied for capital expenditures.

Line 32, Revenue Transfers Applied, shows monies assumed to be transferred to the California Water Fund according to provisions of the Burns-Porter Act and subsequently reappropriated to construction (see Line 37 in Table 14-2). Projected amounts for 2000 through 2015 include funds to finance expenditures for San Joaquin drainage facilities, as indicated in Line 12 of Table 14-1, and expenditures for additional conservation facilities, as indicated in Line 11.

Line 33, Subtotal, Other Capital Financing, is the total of Lines 27 through 32.

Line 34, Total Financing of Capital Requirements, totals Lines 20, 26, and 33.

Annual Revenues and Expenditures

In conducting the financial analysis of SWP operations, the Department concluded that projected payments by contractors and other revenues will be adequate to pay annual operations, maintenance, power, and replacement costs and meet all repayment obligations on funds used to finance SWP construction and other authorized costs during the period 2000 through 2015. Data on annual revenues and expenditures are presented in Table 14-2. A detailed discussion of each line item is presented below.

Project Revenues

SWP revenues consist primarily of SWP contractor payments required under their individual long-term water supply contracts. Those revenues are deposited in two funds: the Central Valley Water Project Revenue Fund, where all revenues pledged to revenue bonds are placed, and the California Water Resources Development Bond Fund-Systems Revenue Account, where all other SWP operating revenues are placed. Use of those funds is limited to paying

operating costs and debt service, except that revenues in excess of those costs may be transferred to the California Water Fund.

Line 1, Capital Resources Revenues, includes

- federal payments for SWP capital expenditures;
- appropriations for capital costs allocated to recreation;
- appropriations for SWP capital expenditures prior to passage of the Burns-Porter Act and according to Senate Bill 261 (1968);
- payments from Los Angeles Department of Water and Power for Castaic power development;
- advances from water contractors for construction of requested works;
- investment earnings on the Capital Resources Account; and
- investment earnings on unexpended revenue bond proceeds.

Historically, appropriations for capital costs allocated to recreation and fish and wildlife enhancement have amounted to \$5 million per year, which have been appropriated by the California Legislature from Tideland Oil Revenues. There have been no appropriations since 1985, and no appropriations are indicated in the Financial Analysis for the period 2000-2015. According to legislation enacted in 1989, a portion of the amount owed to the SWP by the State for costs allocated to recreation and fish and wildlife enhancement was offset against the amount the SWP owed to the California Water Fund (see Line 36).

Lines 2 through 9, Water Contractor Payments, show amounts of the separate elements of water contractor payments.

Amounts in Line 4 also include revenues sufficient to cover costs associated with sales of excess power. Appendix B of this bulletin presents a detailed explanation of payments identified in Lines 2 through 9.

Operations, maintenance, power, and replacement costs are repaid as they are incurred as part of the Transportation Charge; therefore, no interest charges are included. Construction costs included in the Transportation Charge and all construction and annual OMP&R costs included in the Delta Water

Charge are to be repaid with interest at the Project Interest Rate.

The Project Interest Rate, as defined in Article 1(r) of the standard provisions for water supply contracts, is the weighted average of the rates paid on certain securities issued and loans obtained to finance SWP facilities, as described below.

According to the original contract provisions, the basis for determining the Project Interest Rate was the weighted average of rates paid on general obligation bond sales only. In 1969, after Oroville Revenue Bonds were issued, the contract was amended to expand the basis to include rates on all other securities sold and loans obtained thereafter for financing SWP facilities, including revenue bonds (see Bulletin 132-70, page 28).

However, not all proceeds from the sale of revenue bonds are melded into the calculation of the Project Interest Rate. Only those proceeds applied to construction costs (the only application of general obligation bonds permitted by law) and those consumed by the bond discount (a component of the total interest cost of a revenue bond issue) are included in the calculation (see Table 14-8).

Calculations for determining the Project Interest Rate do not include proceeds from the sale of revenue bonds for Off-Aqueduct Power Facilities, the East Branch Enlargement facilities, or water system facilities defined in the Water Revenue Bond Amendment. Table 14-9 lists all bond sales by date and presents basic information used in the calculation of the Project Interest Rate.

Information about contractor water charges in Appendix B is based on known conditions and substantiates the Department's determination of 2001 water charges to be billed July 1, 2000. However, information about significant differences between the sum of future charges included in Lines 2 through 9 of Table 14-2 and the substantiation of 2001 charges included in Appendix B are as described below.

- Future capital costs in Appendix B are based on the prevailing prices as of December 31, 1999. Those costs presented in the financial analysis include allowances for price escalation.

- Pre-2000 charges in Appendix B represent charges as they should have been according to currently known conditions. Pre-2000 charges included in Table 14-2 are those actually paid as part of previously determined bills.
- Charges in Appendix B are unadjusted for past overpayments or underpayments. Charges included in Table 14-2 for 2000 and thereafter have been adjusted for any apparent overpayments or underpayments of pre-2000 charges.
- Charges in Appendix B for East Branch Enlargement costs include the amounts for debt service and 25 percent cover for the East Branch Enlargement share of the Series A through Series V bonds. Charges in Table 14-2 also include amounts of the debt service and cover for assumed future bonds.
- The water revenue bond surcharge in Appendix B applies only to the Series B through Series V bonds. Surcharge values included in Table 14-2 apply to Series B through Series V bonds and to assumed future issues required to finance SWP construction costs included in Table 14-1.

Line 10, Subtotal, Water Contractor Payments, is the total of Lines 2 through 9.

Line 11, Revenue Bond Cover Adjustments, represents the credit to contractors resulting from the cover of 25 percent of 1 year's debt service for Off-Aqueduct Power Facility Bonds and Water System Revenue Bonds. Cover is collected as required by the bond resolutions to provide security to the bondholders. If not needed to meet annual bond service, the cover is credited to the contractors in the following year. The annual charges for the following cost components include an amount for bond cover:

- minimum OMP&R component of the Transportation Charge for Off-Aqueduct Power Facilities
- Water System Revenue Bond Surcharge
- capital cost component of the Transportation Charge for East Branch Enlargement Facilities
- capital cost component of the Transportation Charge for Coastal Branch Extension Facilities
- capital cost component of the Transportation Charge for East Branch Extension Facilities

Line 12, Rate Management Adjustments, shows the projected amount of revenue reductions allocated to SWP contractors after repayment of the California Water Fund (see Line 36). Under provisions of the Monterey Amendment, the reduction amount allocated to agricultural contractors is deposited into a trust fund to stabilize payments in water-short years. The urban contractor allocation is applied as a direct reduction in charges.

Line 13, Federal Payments for Project Operating Costs, shows federal payments made according to the December 31, 1961, agreement between California and the United States providing for the Department to operate and maintain the San Luis Joint-Use Facil-

ities. According to the January 12, 1972, supplement to the agreement, the U.S. Bureau of Reclamation initially paid 45 percent of OM&R costs for those activities. (The percentage does not apply to power costs; USBR and the Department provide their own power to pump water through the joint facilities.)

The percentage paid by USBR is periodically reviewed by USBR and the Department. The most recent review of the percentage paid by USBR was completed in 1987 and resulted in a federal share of 44.09 percent. The amounts in Line 13 are based on the assumption that the federal share will continue at 44.09 percent for calendar years 2000 through 2015.

Table 14-8

Portion allocated to Project Interest Rate		63,856,942	2,946,804	4.615	4.615

^a A unit equivalent to one dollar of principal amount outstanding for one year.

^b The total interest cost (without regard to discounts paid or premiums received) divided by the total dollar-years, expressed as a percent.

^c Determined by dividing cumulative interest costs by cumulative dollar-years, expressed as a percent. Excluding Oroville Field Division bonds and revenue bonds for Off-Aqueduct Power Facilities, the East Branch Enlargement facilities, East Branch Extension facilities, or water system facilities as defined in the Water Revenue Bond Amendment.

2008																																

Line 14, Appropriations for Operating Costs Allocated to Recreation, shows appropriations made under the Davis-Dolwig Act. In passing the Davis-Dolwig Act, the California Legislature declared its intent that except for funds provided according to Assembly Bill 12 (1966), the Department budget will include appropriations of monies from the General Fund necessary for enhancement of fish and wildlife and recreation in connection with State water projects.

Annual OMP&R costs allocated to recreation and fish and wildlife enhancement are to be paid by annual appropriations from the General Fund. For fiscal years 1983-84 through 1998-99, no funds were appropriated for recreation and fish and wildlife enhancement purposes. No appropriations are indicated for 2000 through 2015.

According to legislation enacted in 1989, a portion of the amount owed to the SWP by the State for costs allocated to recreation and to fish and wildlife enhancement was offset against the amount the SWP owed to the California Water Fund (see line 36).

Line 15, Local Agency Payments under Davis-Grunsky Loan Repayment Contracts, shows repayment for \$52.5 million of loans disbursed as of December 31, 1999. Repayment on any future loans was assumed to be beyond the period covered by the financial analysis.

Line 16, Revenue Bond Proceeds, includes bond proceeds classified as special reserves according to the description of revenue bond financing in Line 16 of Table 14-1. Those proceeds, used for capitalized OMP&R costs, revenue bond debt service, and debt service reserves, are not classified as revenues but are included in this line to simplify the financial presentation.

Line 17, Interest Earnings on Operating Revenues, includes interest earnings on unexpended proceeds from the sale of general obligation bonds, interest on operating reserves, and other short-term investment earnings on SWP revenues.

Line 18, Payments under Oroville-Thermalito Power Sale Contract, shows payments from Pacific Gas and Electric Company, Southern California Edison Com-

pany, and San Diego Gas and Electric Company. Those utilities purchased all power generation from Hyatt and Thermalito powerplants before April 1, 1983, according to a power sale contract dated November 29, 1967. The 1952-99 entry includes amounts of final settlement of payments made according to the contract.

Line 19, Miscellaneous Revenues, includes all other operating revenues not included in Lines 2 through 18.

Line 20, Subtotal, Other Revenues, is the total of Lines 13 through 19.

Line 21, Total Operating Revenues, is the total of Lines 10, 11, 12, and 20.

Line 22, Total Operating Revenues and Capital Resources Revenues, is the total of Lines 1 and 21.

Project Expenses

Project expenses include

- operations, maintenance, and power costs
- deposits to replacement reserves
- deposits to special reserves
- capital resources expenditures
- debt service

Revenue bond proceeds earmarked for debt service during construction and the first year's operating expenses are deposited in the Central Valley Water Project Construction Fund and disbursed according to resolutions authorizing the issuance of such bonds.

Water contractor revenues associated with power facility operating costs and debt service are deposited in the Central Valley Water Project Revenue Fund for appropriate disbursement. All other operating revenues are deposited in the California Water Resources Development Bond Fund-Systems Revenue Account and are disbursed according to the following four priorities of use as specified in the Burns-Porter Act:

1. SWP operations, maintenance, power, and replacement costs;
2. general obligation bond debt service;

3. repayment of expenditures from the California Water Fund; and
4. deposits to a reserve for future SWP construction.

Project expenses are presented in Lines 23 through 33 of Table 14-2.

Line 23, Project Operations, Maintenance, and Power Costs, shows the OM&P portion of the historical and projected costs presented in Table 14-10 on page 189.

Table 14-10 and Line 23 of Table 14-2 also include amounts of the operations and maintenance costs for the federal share of joint facilities and those OM&P costs allocated to recreation, which are intended to be offset by revenues indicated in Lines 13 and 14.

Allowances for cost escalations are included in OM&P costs through the year 2002. Allowances for additional long-term price escalations in the future are not included in these estimates because changes in OM&P costs do not substantially affect the overall results of the financial analysis. (For the most part, changes in OM&P costs cause direct offsetting changes in operating revenues.)

Power costs make up the major item of annual operating expenses for the SWP. Assumptions about future power sources and costs are discussed in Chapter 10, "Power Resources." Line 23 also includes costs associated with power transactions that result in the sale of power not required for the delivery of water.

Line 24, Deposits to Replacement Reserves, shows funds set aside as required by contract for replacing existing SWP facilities. By December 31, 1999, \$61.9 million had been spent for replacement costs; the balance of the replacement reserve as of that date was \$20.1 million. Replacement reserve amounts are also included in Table 14-10.

Line 25, Deposits to Special Reserves Under Revenue Bond Financing, includes two significant components: special reserve deposits related to revenue bonds and capital resources revenue carryover from prior years used for construction in the current year. Special reserve deposits are the net of several income

and expenditure items. Income items related to revenue bonds are as follows:

- proceeds set aside to pay bond interest during construction (capitalized interest)
- proceeds set aside for first year operating costs (capitalized operations and maintenance)
- water contractor payments or bond proceeds set aside for debt service reserves
- water contractor payments for revenue bond cover requirements
- deposits to and withdrawals from operating reserves to meet day-to-day cash flow requirements

The 1952-99 column also includes advances to the Department's revolving fund for working funds to purchase mobile equipment and to meet day-to-day operating expenses.

The expenditure items related to revenue bonds are as follows:

- debt service cover payments returned to water contractors
- debt service reserve payments returned to water contractors
- surplus account funds returned to water contractors or applied to meet expenses
- total capitalized interest paid out
- total capitalized operations and maintenance paid out

Special reserves, reduced over time as reserved amounts, are used for their respective purposes. The amount indicated each year in Line 25 indicates the change from the previous year. A negative number indicates a withdrawal of special reserves to meet expenses, while a positive number indicates a deposit.

Line 26, Capital Resources Expenditures, includes the amount of capital resources revenues applied to construction that is shown in Line 31 of Table 14-1. In Table 14-2, these expenditures are funded out of withdrawals from the reserves in Line 25 and do not affect net revenues shown in Line 35.

Lines 27 and 28, Payment of Debt Service on Bonds Sold through December 31, 1999, show the total

principal and interest payments on bonds sold to date. Table 14-11 on page 190 summarizes payments on general obligation bonds (Series A through Y water bonds), power revenue bonds by project, and water system revenue bonds (Series A through V).

Lines 29 and 30, Payments on Projected Future Water Bonds, include the projected annual debt service amounts for future water revenue bonds included on Lines 23 and 25 of Table 14-1 for the East Branch Extension and other water system facilities. Assumptions about the service on these future bonds are as follows:

- Interest costs for the water revenue bonds average 6.0 percent; and
- Bonds are to be repaid within 35 years of sale with maturities commencing in the year following the date of sale and with equal annual bond service for the principal repayment period.

Lines 31 and 32, Total Payments of Bond Debt Service, show the total of principal payments indicated on Lines 27 and 29 and the total of interest repayments indicated on Lines 28 and 30.

Line 33, Subtotal, Debt Service, is the total of Lines 31 and 32.

Line 34, Total Operating Expenses and Debt Service, is the total of Lines 23, 24, 25, 26, and 33.

Line 35, Net System Revenues, shows the annual amounts of revenues remaining after the payment of operating costs and bond debt service costs.

Line 36, California Water Fund Repayment, shows the total amount of repayments made to the California Water Fund to reimburse the fund for monies expended for construction of the State Water Resources Development System.

Repayment of the California Water Fund was completed in 1998 after reimbursements totaling \$508 million. In addition to the \$297 million of repayments shown in Line 36, \$211 million of reimbursement was credited to the SWP as offsets for recreation and fish and wildlife enhancement expenditures.

Line 37, Revenues Used for Capital Expenditures, includes the amounts required annually for financing scheduled capital expenditures. Revenues not needed for operating costs, debt service, or repayment of the California Water Fund are available for financing SWP capital expenditures.

Future Costs of Water Service

Estimates of future water costs are useful to SWP contractors in short-range and long-range planning of water needs, operations, and budgets.

Unit water charges shown in Table 14-12 represent both unescalated and escalated costs of water according to service areas for years 2001 and 2006. The unit rates in Table 14-12 include costs of existing and future SWP facilities accounted for in Table 14-1 and Table 14-7. The unit charges are based on the assumption that in 2001 and 2006, the SWP will be able to deliver the entire amounts of water requested by contractors. The unit water charges included in Table 14-12 are listed both as unescalated 1999 dollars and as escalated rates reflecting assumed future inflation.

The Department's estimates of future capital expenditures include allowances for escalation of construction costs at 3 percent per year for 2000 through 2001 and at 4 percent per year for 2002 through 2015. The escalation rates for future power sources vary, depending on the source of energy.

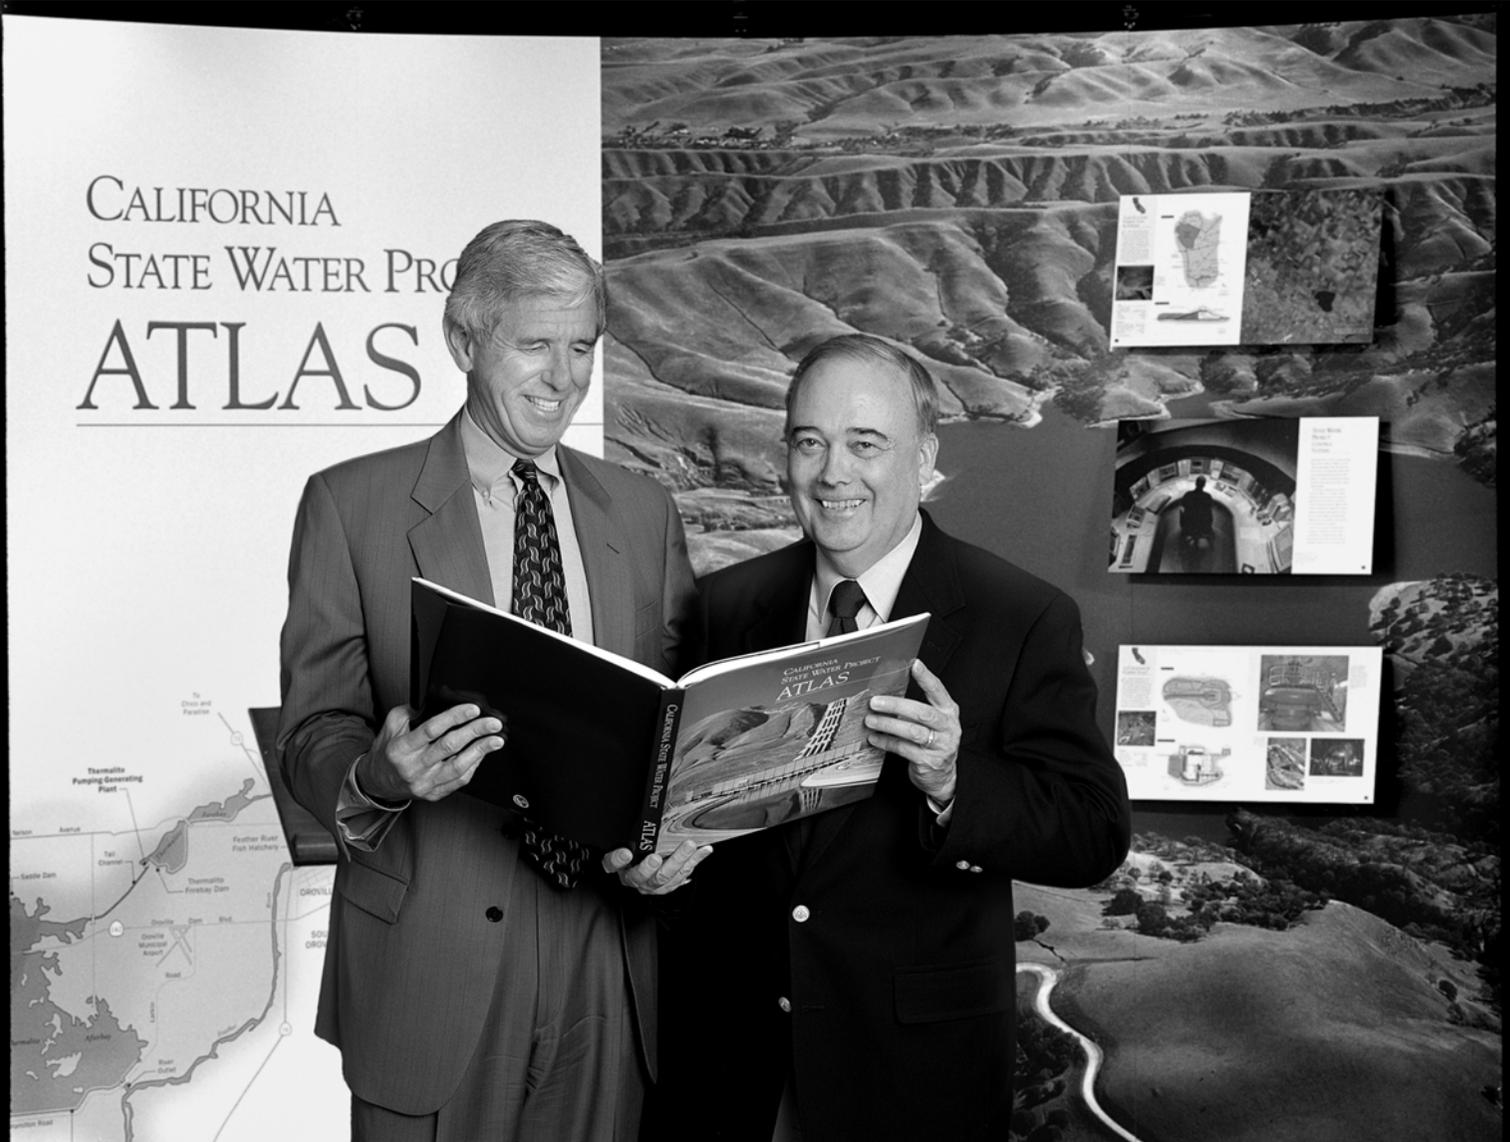

Table 14-12
Estimated Unit Water Charges for 1999 and 2004, by Service Area
(Dollars per Acre-Foot)

<i>Service Area and Charge</i>	<i>2001</i>		<i>2006</i>	
	<i>Unescalated</i>	<i>Escalated</i>	<i>Unescalated</i>	<i>Escalated</i>

Information for this chapter was provided by the State Water Project Analysis Office in conjunction with the Division of Fiscal Services.

Chapter 15

SWP Education and Information

Director Hannigan and former Director Kennedy reviewing the *California State Water Project Atlas*

Significant Events

- The Office of Water Education provided information on Y2K preparedness to water agencies throughout California and helped coordinate Department information with the overall State government effort. The year-end effort capped a calendar of events resulting in news releases to the media.
- News events in 1999 included the fifth straight wet year and full deliveries to the State Water Project, cutbacks in pumping from the Delta for fishery protection, progress on the Colorado River Agreement, and other SWP-related events.
- In February, the Governor announced the appointment of Thomas M. Hannigan as Director of the Department of Water Resources.
- The *California State Water Project Atlas*, a new publication of SWP facilities with photographs and statistics, was distributed to the State Water Contractors and major water organizations. Sales to the public are scheduled to begin in 2000.
- OWE participated in educating Department employees, stakeholders, and the public about the lengthy process required for renewal of the Department's federal license to operate hydroelectric and related facilities at Oroville, including Oroville Dam.

The Department of Water Resources' Office of Water Education conducts public information and education programs to inform the news media and educate the public about the value and operations of the State Water Project. These programs use an array of public outreach methods, including news media relations, publications, videos, Internet sites, SWP visitors centers and tours, brochures, exhibits, and special events.

SWP Information and Education Programs

Media Outreach

Y2K Preparedness. OWE's role in preparing SWP facilities and the Department for the rollover to year 2000 included briefings with Department Y2K project management, issuing news releases announcing SWP and California Data Exchange Center readiness, and coordinating with the Department of Information Technology on inquiries from the public and news media.

A brochure emphasizing Y2K readiness was written by the Department and distributed to California's 4,200 water agencies. In addition, OWE information staff supported the Office of Emergency Services in its New Year's Eve rollover coverage.

Flood Preparedness. The Internet provided the public and news media with information on flood preparedness and emergency work. A new flood update site was augmented in 1999 with maps of the Sacramento and San Joaquin river systems and the State's hydrologic regions. These sites can be downloaded in different formats. During winter 1999, the news media was informed of Web sites where they could retrieve Department reports of reservoir conditions and river flows. Many television stations began using graphs generated by CDEC and interpreted by Department information officers.

OWE participated with other Department units in the Governor's annual Winter Weather and Flood Preparedness Week activities in October, coordinated by

OES. The Joint Operations Center was once again the site of this event and news conference.

News Events. The Department notified news media of the following major SWP and related highlights of 1999:

- announcement to SWP contractors of full SWP deliveries for 1999;
- successful negotiations among the largest California water agencies that utilize Colorado River water supplies;
- completion of major repairs to the east and west branches of the California Aqueduct;
- completion of the Feather River Fish Hatchery expansion project and announcement of a subsequent spawning run;
- launching of a project to revitalize the bass fishery at Silverwood Lake;
- initiation of a series of public meetings to gather information and comments for the updated Department bulletin on the State's groundwater resources, scheduled for completion in 2002;
- installation of barriers in the Delta to prevent Chinese mitten crabs from overwhelming fish salvage operations at SWP and Central Valley Project facilities; and
- publication of the *California State Water Project Atlas*.

Community Relations

OWE developed the Lake Oroville recreation Internet Web site which has information for tourists on the lake's recreation opportunities and other area facilities and attractions. A video with scenes of salmon

returning to the Feather River Fish Hatchery was produced and posted on the Web site. In addition, the Department provided photography support to the City of Oroville and the Oroville Area Chamber of Commerce for various community events. Other activities for the Oroville area are listed in the video projects section below.

State Sesquicentennial

Commemoration of California's 150th year of statehood was a special focus of OWE during 1999. Traveling exhibits showing "150 Years of Water History," supplemented by a brochure, were displayed in dozens of California communities.

Publications

SWP Brochures. Revisions continued in 1999 on the 26 individual publications in the State Water Project Brochure Series, including the revised Project Operations Center, Edmonston, and a new Oroville recreation brochure. An ordering form was placed on the Internet for the convenience of teachers and the general public. More than 100,000 SWP brochures were distributed statewide in 1999.

DWR News. The spring issue of *DWR News* featured the Delta invasion by Chinese mitten crabs, an explanation of the effects on the SWP of the 1998 deregulation of the electrical industry, construction of the East Branch Extension, and prospects for future water recycling in the State.

As part of the anniversary of statehood, the fall issue was primarily devoted to a review of 150 years of water history. Other articles covered the relicensing of the Oroville-Thermalito Complex, operation of the Yolo Bypass, Department support for salmon revival on the Merced River, and masterplanning flood protection in the Central Valley.

E-News. For the past several years, the Department has made a daily e-mail distribution to Department management of major newspaper articles of interest on the SWP and the Department. Distribution has widened to include several thousand individuals and agencies throughout the State, SWP contractors, municipal and private water agencies, other government departments, and educators and librarians.

DWR People. The Department's employee newsletter continued as a quarterly publication during 1999. Stories spotlight employee individual and team accomplishments, skills, awards, promotions, retirements, and other news items. Employee communication is also promoted by *DWR Update*, the employee-only online newsletter that provides accounts of Department changes and events, employee assignments and accomplishments, news items on statewide water issues, and various announcements.

Video

Lake Oroville. To promote attendance at Oroville's Feather Fiesta Days, a public service announcement was created and airtime purchased on six Northern California television stations (one Spanish language). This resulted in record attendance for the Hyatt Power Plant tour. Another public service announcement encouraged attendance at Oroville's Fourth of July event and fireworks display.

SWP Construction and Related Projects. The Department videotaped the East Branch Extension groundbreaking and construction; dedication of the Merced River Fish Hatchery; and round-the-clock repairs of aqueduct pools 54 and 49. Other video projects in 1999 included aerial mapping of the California Aqueduct with Global Positioning Satellite identification; efforts to reduce agricultural drainage into the San Joaquin River; and audio and videotaping of meetings, press conferences, and public hearings for the CALFED Bay-Delta Program throughout the State. Videotaping support was also provided to the Delta Protection Commission, Delta levee work, and environmental mitigation.

OWE provided support to Central Valley flood preparedness efforts by producing and distributing public service announcements on how to prepare sandbags to local television stations. This was supplemented by community outreach efforts in Oroville and Los Banos with local emergency service coordinators.

Recognition. The Department's Video unit won industry awards for the children's water education video *Water: Who Needs It?* from Cinema in Industry and the California Association of Public Information Officials.

Photography

The Department's photography unit provided documentation of fishery restoration at Silverwood Lake and coverage of both the fish ladder opening and the Salmon Festival at Oroville.

Other projects included monthly photo-progress reports on the construction of the East Branch Extension and other Southern California projects.

Visitors Centers Program and Promotion

During 1999, 632,703 visitors were welcomed at the five SWP visitors centers and facilities listed in Table 15-1.

Table 15-1
Visitor-Days Recorded in 1999, by Location

Field Division	Visitor-Days
Oroville	277,261
Delta	1,646
San Luis	212,693
San Joaquin	4,165
Southern	136,938
Total	632,703

Exhibits were updated at Romero and Vista del Lago visitors centers. Revised SWP facilities maps, featuring the location of the SWP visitors centers, were produced and distributed. SWP recreation display maps at major highway rest stops were repaired or replaced.

Promotional brochures for Vista del Lago, San Luis, and Oroville visitors centers were placed in hotels and travel agencies. Newspaper and magazine ads were also prepared to promote Oroville recreation.

Travel planners were encouraged to schedule trips for senior groups to SWP visitors centers. Tabletop displays were set up at travel conferences and promotional items, such as tote bags and sports bottles, were distributed.

SWP Tours

During 1999, the Department welcomed 625 visitors from the following countries: China, Japan, India, Egypt, the Netherlands, New Zealand, Canada, Australia, Korea, Taiwan, Tanzania, the Philippines, Portugal, and several Central Asia republics.

A year 2000 calendar derived from the *California State Water Project Atlas* graphics and text was produced and distributed to visitors touring the SWP.

Evaluations of Visitors Centers

Staff conducted evaluation surveys at Vista del Lago, Romero, and Oroville visitors centers. A total of 1,044 visitors participated in the surveys. Results showed a high level of satisfaction with information provided at these facilities.

Water Safety Education

The Department published a Spanish version of the *Albert and Einstein Water Safety Activity* coloring book, designed to increase children's awareness of the dangers of playing near the California Aqueduct.

The English and Spanish aqueduct safety radio messages, "Warning! Danger Lurking in California" and "Notorious Killer" water safety spots, were produced to appeal to young adult males. The announcements were targeted during early summer to listeners in the lower San Joaquin and Antelope Valleys.

Water safety video messages were also played to visitors at the annual Cal Expo Boat Show and Sportsmen's Expo in Sacramento.

Graphic Services Displays and Exhibits

During 1999, the Department created the following items related to the SWP:

- exhibits, videos, and informational materials for use at the spring and fall Association of California Water Agencies conferences;
- exhibit and presentation boards depicting repairs at milepost 54;
- League of California Cities conference exhibit providing information on sources of California water, emphasizing the SWP;
- exhibits and materials promoting recreation along the SWP for the Sportsmen's Expo;
- revised and updated outdoor display kiosks at Lake Davis and Frenchman Lake, with information about the lakes and the SWP;

- Devil Canyon Power Plant lobby display describing power plant and hydroelectric generation, with an overview of the SWP; and
- a lobby display for the Lake Oroville Visitors Center.

School Education Program

The program's goal is to provide students and educators with a statewide perspective on water issues and concepts. The Department develops and promotes high quality materials, provided free to schools, educators, and water districts.

Key projects for 1999 included

- a single video that combined the productions, *The Water Cycle*, *Water: Who Needs It?*, and a 30-second water safety animation for children in grades Kindergarten-6 was produced.
- promotion of the Department's new Children's Video Series and Teacher Activity Packets at conferences of the California Science Teachers Association, and the Association of Resource Conservation Districts. The packet provides instructors with materials that can be easily reproduced at very low cost.
- display of the Department's children's exhibits at the ACWA "School Open House." Water agencies from around the State had the opportunity to view all the Department's children's exhibits, including one on the California Aqueduct.
- education materials developed for the Lake Oroville Visitors Center.
- The Water Facts and Fun catalog and order form for education materials were updated.
- the Department coordination and participation in Water Education Committee meetings.
- Department participation in a State summit to develop a plan for environmental education.
- Department cosponsorship of the Environmental Campaign for fifth grade students, with the State of California and the Walt Disney Corporation.

- The Department provided assistance to the Department of Education's Regional Environmental Education Coordinators and the Aquatic Outreach Institute's Educator Conference on Creeks, Wetlands and Watersheds.

Water Awareness Month Activities

During May 1999, the Department, for the twelfth consecutive year, celebrated Water Awareness Month. The theme for the observance was *Use Water Wisely: It's a Way of Life*.

The Department and water agencies throughout the State developed a water education teacher's kit for grades K-6. Approximately 4,000 kits were distributed statewide.

The Department celebrated Water Awareness Month at a series of special events, including

- May 8, Hyatt Power Plant Open House at Oroville Dam. Oroville Field Division sponsored this event, timed to coincide with Feather Fiesta Days, a major Oroville community festival.
- May 15, California Aqueduct Biking Event—a ride along a 28-mile portion of the California Aqueduct in the Antelope Valley of Southern California. Southern Field Division jointly sponsored this event with local bike, trail, and environmental groups.
- May 15, Kids' Fishing Derby at San Luis Reservoir. San Luis Field Division cosponsored this tenth annual event at O'Neill Forebay, with the Department of Parks and Recreation and the Four Rivers Natural History Association.
- May 21, Edmonston Pumping Plant Water Awareness Event—a celebration of California's Sesquicentennial with activities including fishing and demonstrations on water safety and efficient water use. The Department's San Joaquin Field Division hosted 120 students from schools in the Kern County communities of Taft and Bakersfield. The event was covered by regional news media.

Information in this chapter was contributed by the Office of Water Education.

Appendix B

Data and Computations

Used to

Determine 2001 Water Charges

The Department of Water Resources annually furnishes Statements of Charges to the 29 long-term State Water Project water supply contractors. Article 29(e) of the Standard Provisions for Water Supply Contracts, approved August 3, 1962, describes those statements:

All such statements shall be accompanied by the latest revised copies of the document amendatory to Article 22 and of Tables B, C, D, E, F, and G of this contract, together with such other data and computations used by the State in determining the amounts of the above charges as the State deems appropriate.

To comply with Article 29(e), the Department performs an annual comprehensive review and redetermination of all water supply and financial aspects of the SWP for the entire project repayment period. This annual redetermination is performed in accordance with Article 22(f) and Article 28 of the water contracts, which concern the Delta Water Rate and annual transportation charges, respectively.

Appendix B includes data used to document the redetermination of water charges to be paid by contractors during calendar year 2001. The information is based on established data about the SWP, both known and projected, as of June 30, 2000.

The computational procedures and interrelationships between tabulations in this appendix are outlined in Figure B-1 and Figure B-2. All tables referenced in Figures B-1 and B-2 follow this text.

Types of Water Charges

Charges to SWP water supply contractors include the costs of facilities for the conservation and development of a water supply and the conveyance of such supply to SWP service areas. These facilities are

classified as “Project Conservation Facilities” and “Project Transportation Facilities” in the Standard Provisions for Water Supply Contract. The names of the main facilities in each classification follow.

Project Conservation Facilities

- Frenchman Dam and Lake
- Grizzly Valley Dam and Lake Davis
- Antelope Dam and Lake
- Oroville Dam and Lake Oroville
- Oroville power facilities
- Delta Facilities
- A portion of the California Aqueduct from the Delta to Dos Amigos Pumping Plant
- Sisk Dam, San Luis Reservoir, and Gianelli Pumping-Generating Plant

Project Transportation Facilities

- Grizzly Valley Pipeline
- North Bay Aqueduct
- South Bay Aqueduct, including Del Valle Dam and Lake Del Valle
- Remainder of the California Aqueduct from the Delta to Dos Amigos Pumping Plant and all facilities south, including dams and lakes in Southern California
- Off-Aqueduct Power Facilities (Reid Gardner Unit No. 4, Bottle Rock Power Plant, and South Geysers Power Plant)

The standard provisions provide for a Delta Water Charge and a Transportation Charge for project water.

The Delta Water Charge is a unit charge applied to each acre-foot of SWP water the contractors are entitled to receive according to their contracts. The unit charge, if applied to each acre-foot of all such entitlements for the remainder of the project repayment period, is calculated to result in repayment of all

Figure B-1
Relationships of Data Used to Substantiate Statements of Charges

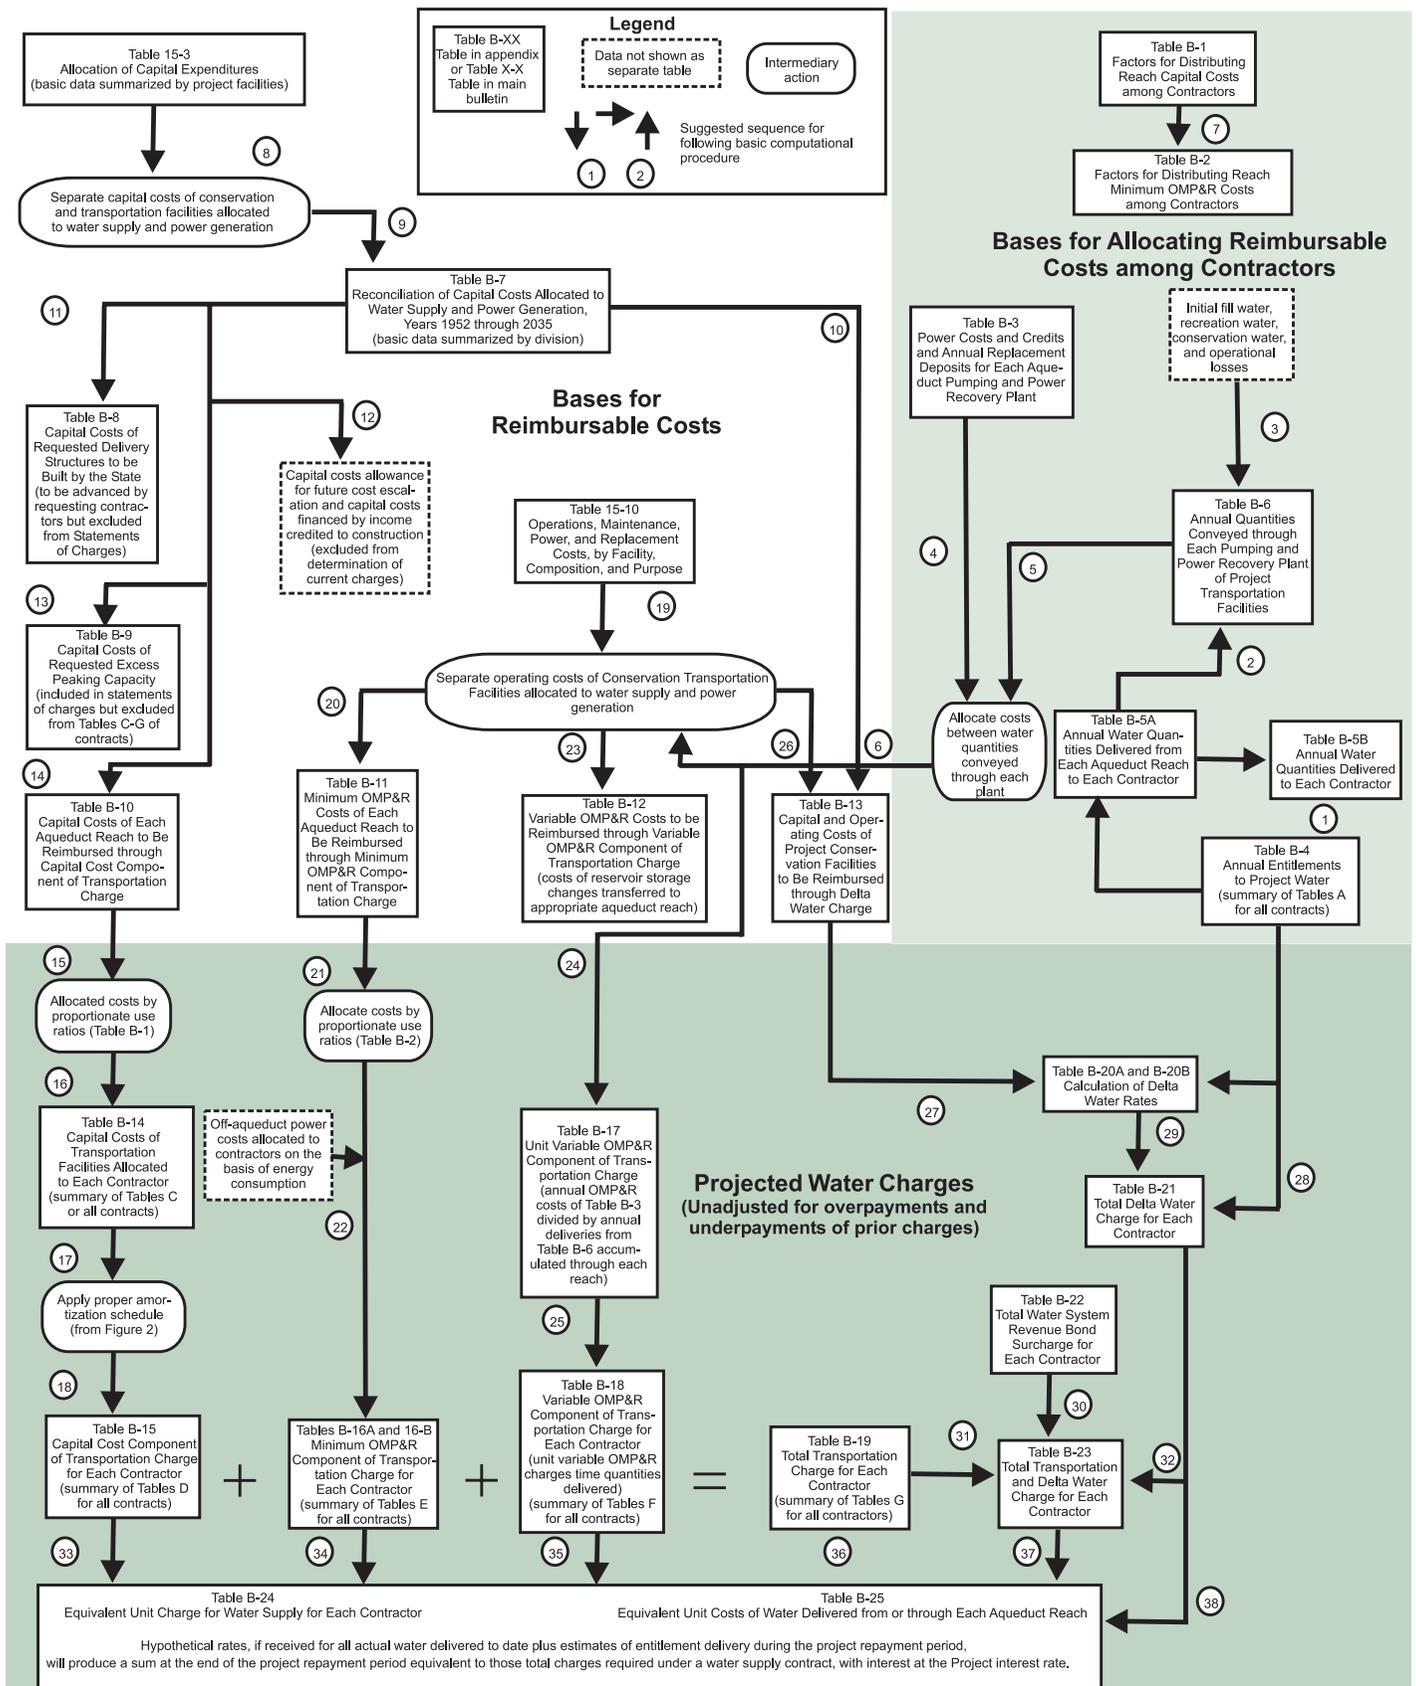

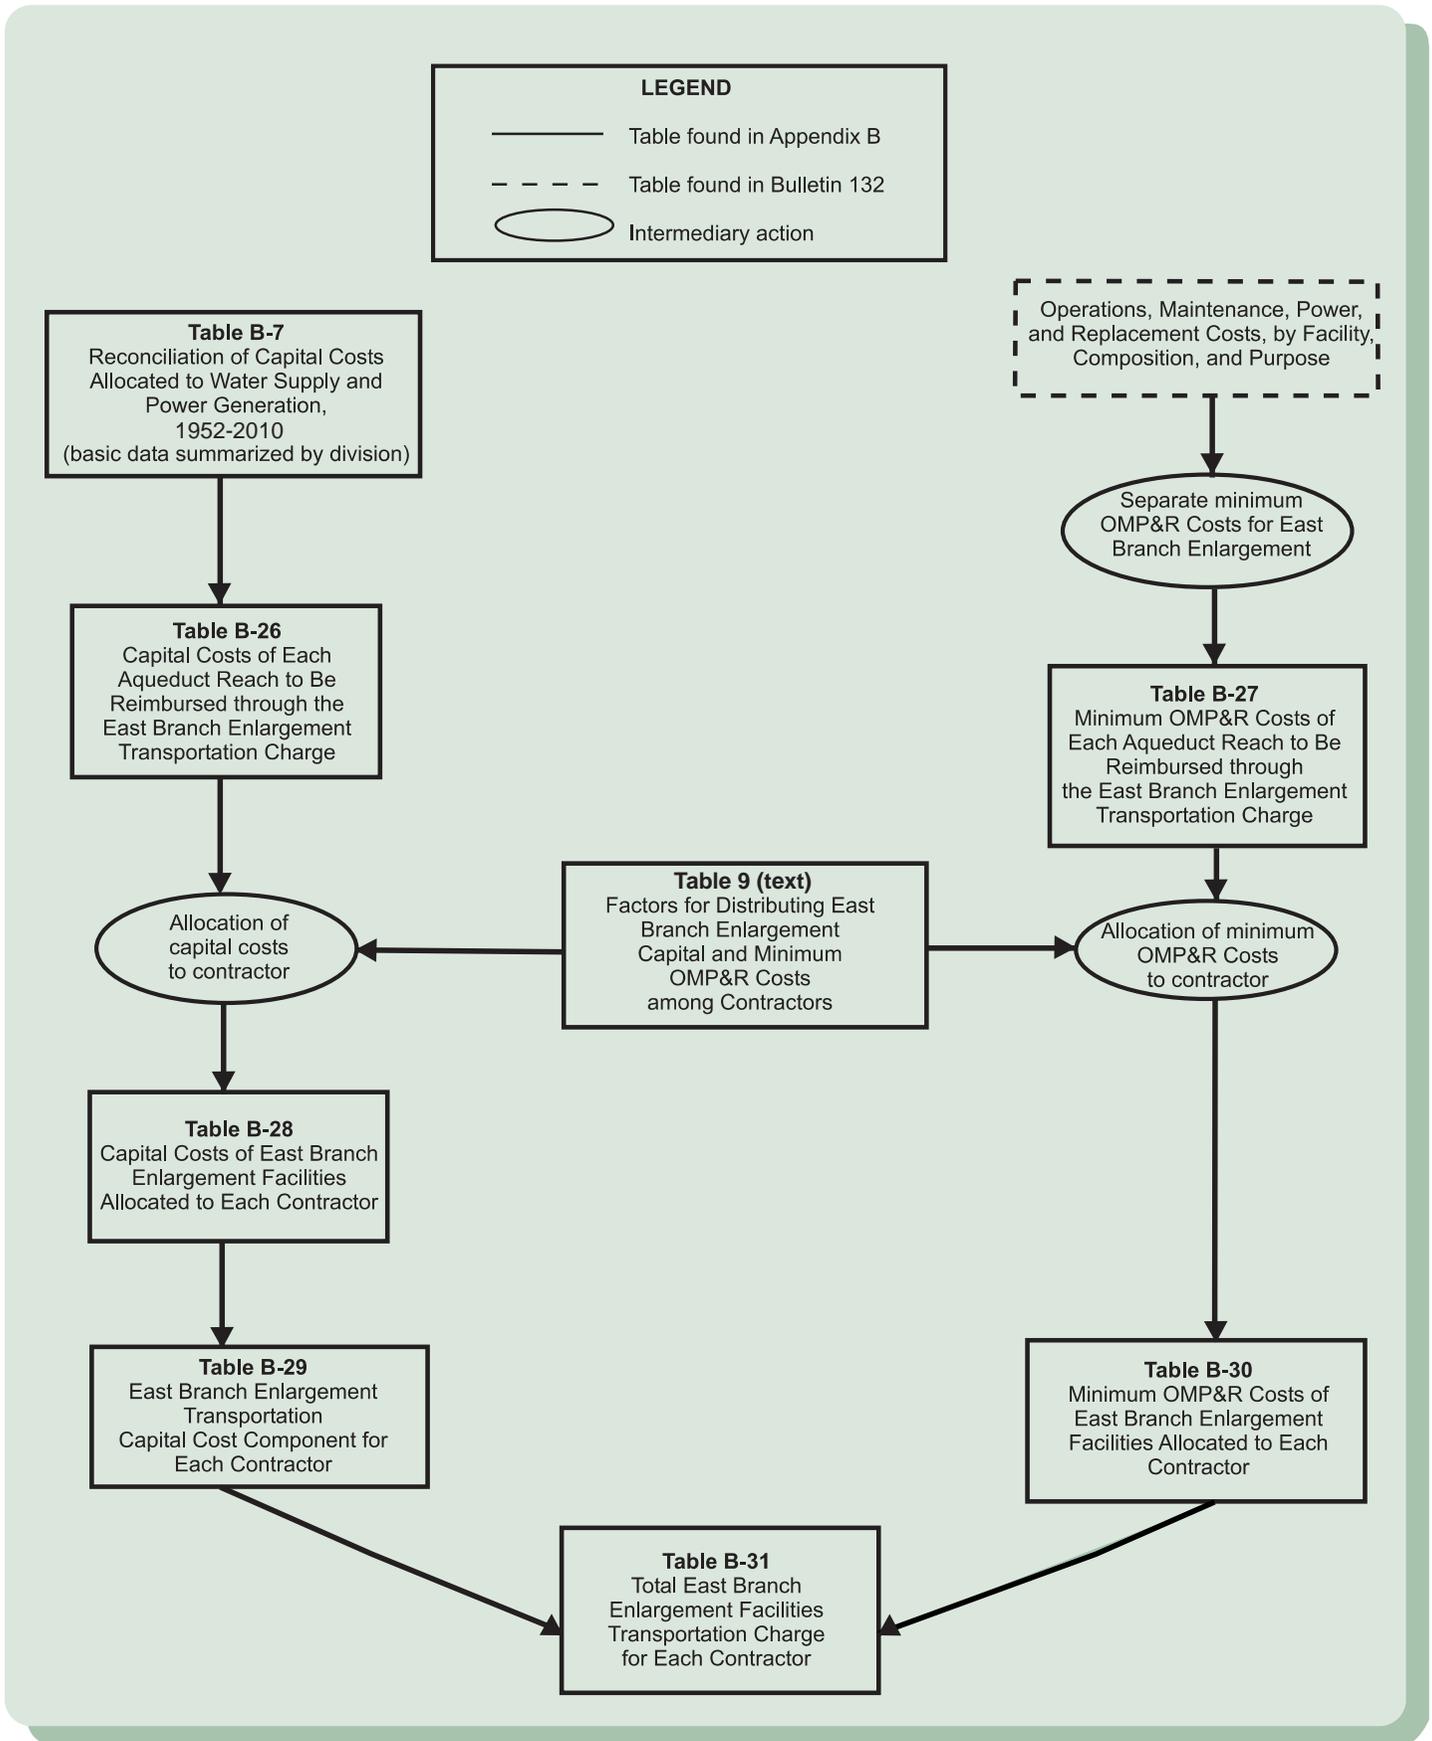

Figure B-2
Relationships of Data Used to Substantiate East Branch Enlargement Charges

outstanding reimbursable costs of the Project Conservation Facilities, with appropriate interest, by the end of the repayment period (2035).

The Transportation Charge is for use of facilities to transport water to the vicinity of each contractor's turnout. Generally, the annual charge represents each contractor's proportionate share of the reimbursable capital costs and operating costs of the Project Transportation Facilities.

Each contractor's allocated share of those reimbursable capital costs is amortized for repayment to the State; and certain variations are allowed in the amortization methods. Essentially, the contractors' shares of reimbursable operating costs are repaid in the year such costs are incurred by the State.

The East Branch Enlargement Transportation Charge is paid by the seven Southern California contractors participating in the enlargement. San Bernardino Valley Municipal Water District advanced funds to pay the district's allocated capital costs for the East Branch Enlargement. The remaining six contractors pay an allocated share of the debt service on revenue bonds sold to finance the enlargement. Each contractor also will pay an allocated share of the minimum operation, maintenance, power, and replacement (OMP&R) costs of the East Branch Enlargement.

Composition and Timing of Water Charges

As shown in Figure B-3, the Delta Water Charge and the Transportation Charge consist of the following three components:

1. Conservation and Transportation capital cost components, which will return to the State all reimbursable capital costs;
2. Conservation and Transportation minimum OMP&R components, which will return to the State all reimbursable operating costs that do not depend on or vary with quantities of water actually delivered to the contractors; and
3. A Transportation variable OMP&R component, which will return to the State all reimbursable operating costs that depend on, and vary with,

quantities of water actually delivered to the contractors.

The formula for computing the Delta Water Rate, Article 22(f) of the Standard Provisions for Water Supply Contract, was designed to ensure that all adjustments for prior overpayments or underpayments of the Delta Water Charge are accounted for in a redetermination of the rate. Since the redetermined rate applies to all future entitlements, such adjustments are amortized during the remainder of the project repayment period. This appendix includes a redetermination of the Delta Water Rate for 2001.

Article 28 of the standard provisions stipulates that Transportation Charges be redetermined each year. The tables in Appendix B include the numerical data used in this redetermination. Transportation Charges for prior years through 2000 included in those tables are the redetermined amounts and do not equal the amounts actually paid by contractors.

As provided under the Water System Revenue Bond Amendment to the water supply contracts, differences between actual payments under the Transportation capital cost component and amounts computed in this redetermination are accumulated with interest and amortized during the remaining years of the contract repayment period. All computations for adjustments are included in the attachments accompanying each contractor's Statement of Charges and are reflected in revised copies of Table C through Table G of the contract, which are also furnished to each long-term water supply contractor in the annual Statements of Charges.

These redeterminations exclude four charges associated with water service other than the Delta Water Charge and the Transportation Charge. The excluded charges (and the manner in which such excluded charges are treated in this appendix) are:

1. Advances of funds pursuant to Article 24(d) of the standard provisions for excess capacity constructed by the State at the request of contractors;
2. Advances of funds pursuant to Article 10(d) of the standard provisions for delivery structures (turnouts) constructed by the State at the request of contractors. Partial information concerning

Figure B-3
Composition of Delta Water Charge and Transportation Charge

Delta Water Charge*Capital Cost Component*

1. Planning, design, right-of-way, and construction costs of Conservation Facilities
2. Operations and maintenance costs for newly constructed Conservation Facilities prior to initial operations
3. Activation costs for newly constructed Conservation Facilities
4. Power costs allocated to initial filling of San Luis Reservoir
5. Capitalized O&M costs (major repair work and so forth) for Conservation Facilities.
6. Program costs (portion) to mitigate impacts on current Delta fishery population due to SWP pumping prior to 1986 (Department of Water Resources-Department of Fish and Game agreement)

Minimum OMP&R Component

1. Direct O&M costs of Conservation Facilities
 - a. Headquarters and field divisions (portion)
 - b. Insurance and FERC costs (portion)
2. General O&M costs allocated to Conservation Facilities
 - a. Contractor Accounting Office (portion)
 - b. Financial and contract administration (portion)
 - c. Water rights
 - d. Power planning for SWP facilities (portion)
3. Replacement deposits for SWP control centers (portion)
4. Credits for a portion of Hyatt-Thermalito power generation
5. Power costs and credits related to pumping water to San Luis Reservoir for project operations (storage changes)
6. Value of power used and generated by Gianelli Pumping-Generating Plant
7. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant (Department of Water Resources-Department of Fish and Game agreement)

Transportation Charge*Capital Cost Component*

1. Planning, design, right-of-way, and construction costs of Transportation Facilities
2. O&M costs for newly constructed Transportation Facilities prior to initial operation
3. Activation costs for newly constructed Transportation Facilities
4. Power costs allocated to initial filling of Southern California reservoirs
5. Capitalized O&M costs (major repair work and so forth) for Transportation Facilities
6. Program costs (portion) to mitigate impacts on current Delta fishery population due to SWP pumping prior to 1986 (Department of Water Resources-Department of Fish and Game agreement)

Minimum OMP&R Component

1. Direct O&M costs of Transportation Facilities
 - a. Headquarters and field divisions (portion)
 - b. Insurance and FERC costs (portion)
2. General O&M costs related to Transportation Facilities
 - a. Contractor Accounting Office (portion)
 - b. Financial and contract administration (portion)
 - c. Power planning for SWP facilities (portion)
3. Power costs and credits related to pumping water to Southern California reservoirs for project operations (storage changes)
4. Power costs for pumping water to replenish losses from Transportation Facilities
5. Other power costs
 - a. Station service at Transportation Facility power and pumping plants
 - b. Transmission service costs related to "backbone" Transportation Facilities
6. Replacement deposits for SWP control centers (portion)
7. Off-Aqueduct Power Facility costs—bond service, bond cover costs (25 percent of bond service), bond reserves, transmission costs to provide service to "backbone," fuel costs taxes, and O&M-less power sales allocated to Off-Aqueduct Power Facilities
8. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant (Department of Water Resources-Department of Fish and Game agreement)

Variable OMP&R Component

1. Power purchase costs
 - a. Capacity
 - b. Energy
 - c. Pine Flat bond service, O&M, and transmission costs allocated to aqueduct pumping plants
2. Alamo, Devil Canyon, Warne, and Castaic power generation credited at the power plant reach and charged to aqueduct pumping plants
3. Hyatt-Thermalito Diversion Dam power plant generation charged to aqueduct pumping plants (credits for this generation are reflected in the Delta Water Rate)
4. Replacement deposits for equipment at pumping plants and power plants
5. Credits from sale of excess SWP system power
6. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant (Department of Water Resources-Department of Fish and Game agreement)

Note: Excludes costs recovered under the East Branch Enlargement Transportation Charge.

actual and projected capital costs of such delivery structures is included in this appendix. Statements concerning these costs and data are furnished to the appropriate contractors at various times and are not part of the annual statements;

3. Payments for sale and service of surplus water to entities other than contractors, pursuant to Article 21 of the standard provisions, are also excluded. Those payments are generally based on the unit rates shown in Table B-25. Net revenues resulting from noncontractor service are applied as indicated on page 24 of Bulletin 132-71; and
4. Payments under the Devil Canyon-Castaic contract for costs of the Devil Canyon-Castaic facilities allocable to power generation. Charges billed as a result of the contract are billed separately from those billed as a result of the water supply contract. Information about the treatment of such charges in relation to redetermined Transportation Charges is included in special attachments to the bills of the six participating contractors.

The time and method of payment for corresponding components of the Delta Water Charge and the Transportation Charge are as follows:

1. The capital cost components of the Delta Water Charge and the Transportation Charge are paid in two semiannual installments, due January 1 and July 1 of each year, based on statements furnished by the State on or before July 1 of the preceding year;
2. The minimum OMP&R components of the Delta Water Charge and the Transportation Charge are paid in 12 equal installments, due the first of each month and based on statements furnished by the State on or before July 1 of the preceding year; and
3. The variable OMP&R component of the Transportation Charge is paid in varying monthly amounts and is due the fifteenth day of the second month following actual water delivery. The charges are projected based on a unit charge per acre-foot established on or before July 1 of the

preceding year. Those unit charges may be revised during the year to reflect current power costs and revenues. The unit charges are applied to actual monthly delivery quantities as determined by the State on or before the fifteenth day of the month following actual delivery.

Bases for Allocating Reimbursable Costs Among Contractors

This section describes the procedures for allocating reimbursable costs of Project Transportation Facilities among contractors (see upper right portion of Figure B-1). Those costs do not include annual costs of Off-Aqueduct Power Facilities, which are explained in the section "Project Water Charges."

Capital and Minimum OMP&R Costs

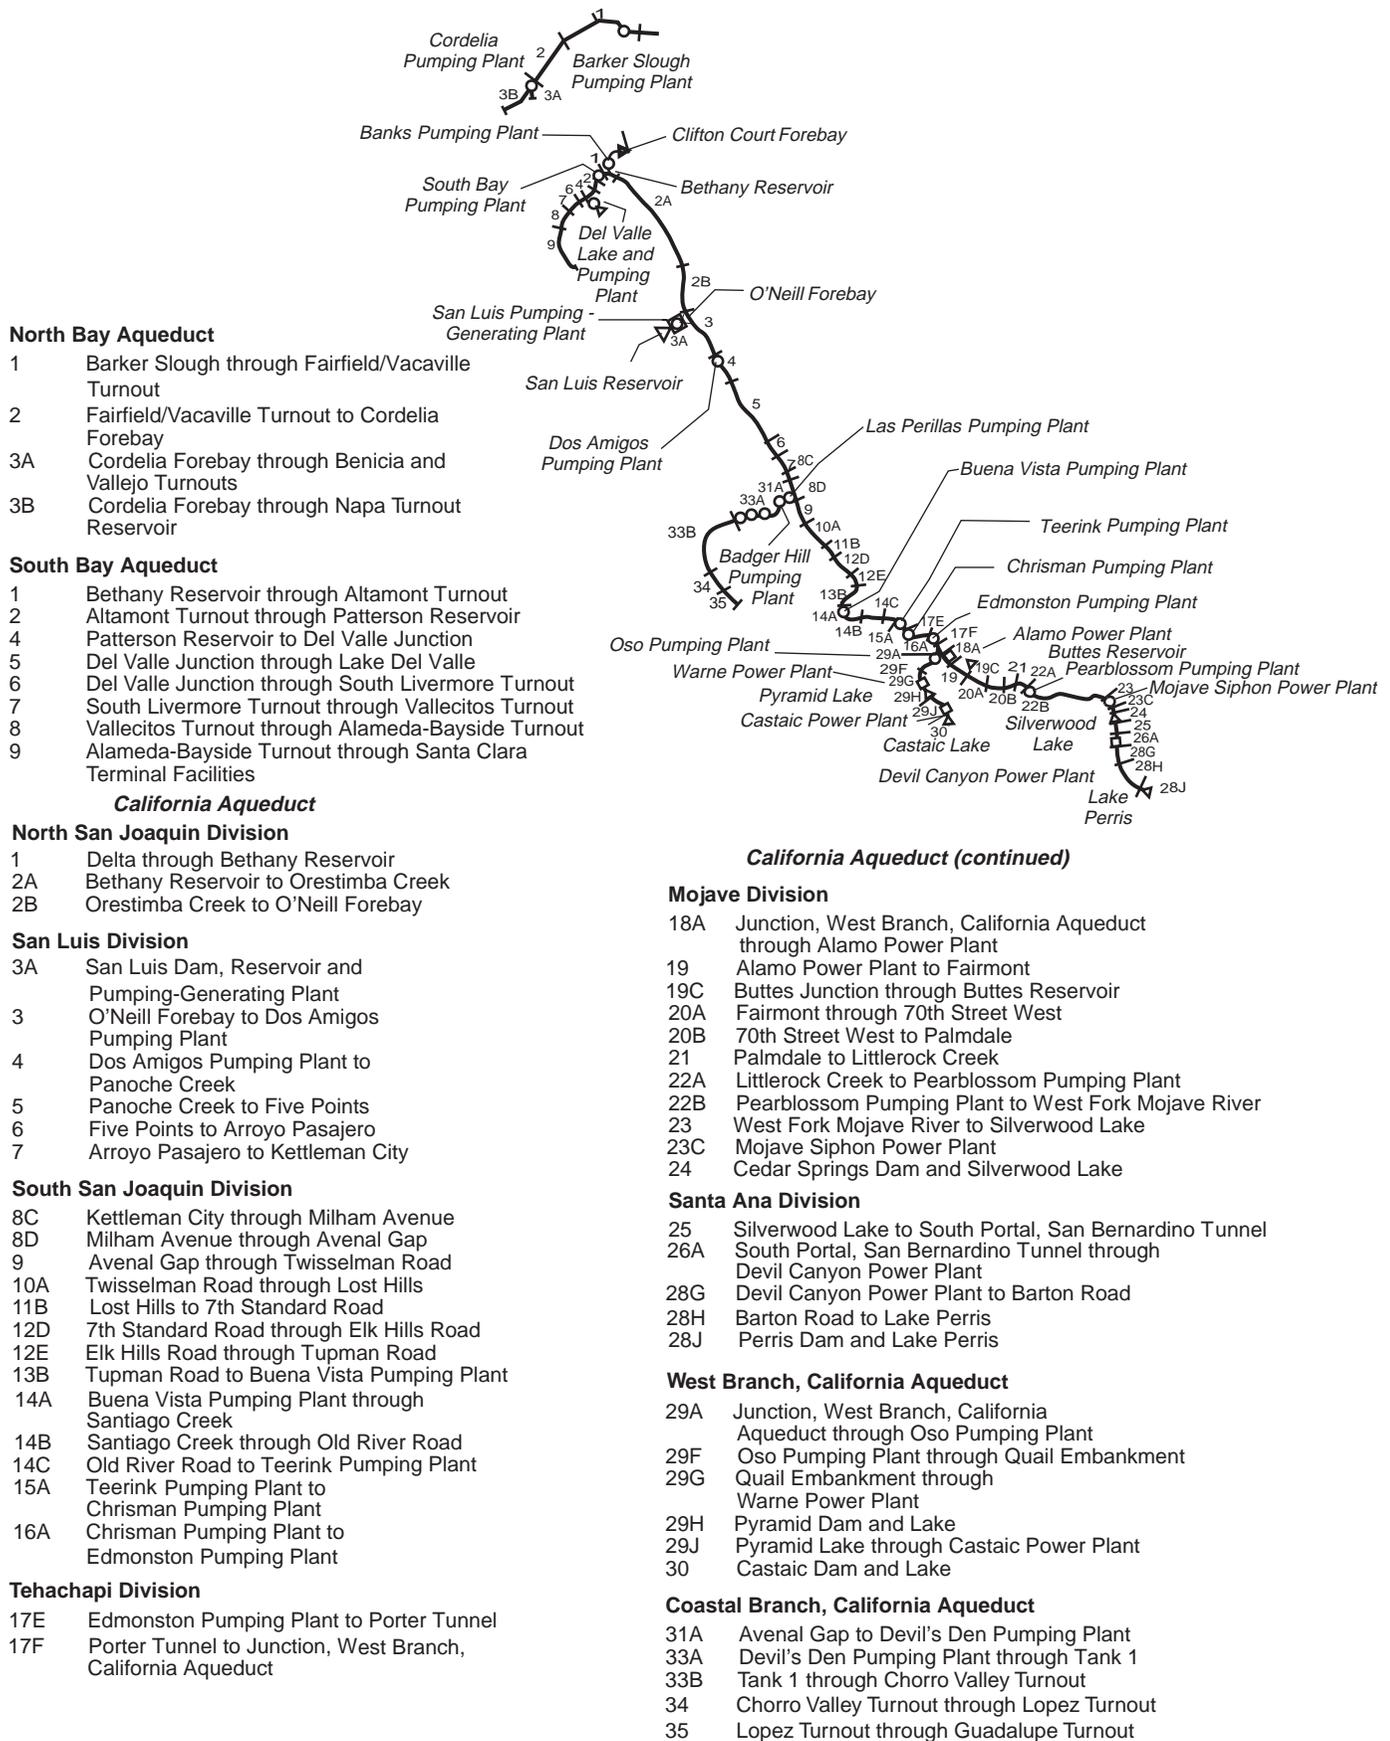

Figure B-4 includes information about the repayment reaches that form the basis for allocating reimbursable costs of the Project Transportation Facilities among contractors.

Allocations of reimbursable capital costs and minimum OMP&R costs of each reach are based on the proportionate maximum use of that reach by respective contractors under planned conditions of full development.

The derivation of ratios that represent the proportionate maximum use of each aqueduct reach by the respective contractors was first reported in Bulletin 132-70. The ratios in Bulletin 132-70 were subsequently revised for the North Bay Aqueduct, the South Bay Aqueduct, the California Aqueduct from the Delta to Castaic Lake, and the Coastal Branch.

All the revisions reported in previous bulletins regarding the derivation of ratios that represent the proportionate maximum use of each aqueduct reach by the respective contractors were last reported in Tables B-1 and B-2 of Bulletin 132-91. Beginning in 1998, the ratios for the California Aqueduct from the Delta to Silverwood Lake, plus Reach 31A, were revised to reflect the permanent transfer of 25,000 acre-feet from the Kern County Water Agency to the Mojave Water Agency. Beginning in the year 2000, the ratios for the California Aqueduct from the Delta to Castaic Lake were revised to reflect the permanent transfer of 41,000 acre-feet from Kern

**Figure B-4
Repayment Reaches and Descriptions**

County Water Agency to Castaic Lake Water Agency.

Table B-1 presents the reach ratios currently applicable to reimbursable capital costs.

Table B-2 presents corresponding ratios for allocating 2000 reimbursable minimum OMP&R costs among contractors. Requested excess capacity is omitted when deriving ratios applicable to capital costs because the capital costs for the excess capacity are paid on an incremental-cost basis and not a proportionate-use basis. However, requested excess capacity is accounted for in the ratios applicable to minimum OMP&R costs.

Variable OMP&R Costs

Article 26(a) includes provisions to ensure that the variable OMP&R component of the Transportation Charge will result in a return to the State of those costs that depend on and vary with the amount of SWP water deliveries. (The minimum OMP&R component results in a return of those operating costs that do not vary with deliveries.) Under Article 26(a) all such costs for a reach for a given year will be allocated among contractors in proportion to the actual annual use of that reach by the respective contractors.

Table B-3 summarizes the total power costs and credits for each aqueduct pumping and power recovery plant. Those variable costs consist of:

- Costs of capacity and energy used exclusive of associated power transmission and station service charges (transmission and station service costs are classified as minimum OMP&R costs);
- Credits for capacity and energy produced at aqueduct power recovery plants (treated as negative costs); and
- Payments for replacement of major plant machinery components having economic lives shorter than the project repayment period. In 1997, the Department discontinued charging for a sinking fund for replacements. Replacement costs for 1999 and thereafter are to be paid on an annual basis as the costs are incurred.

Table B-3 excludes plant capacity and energy costs associated with surplus and unscheduled water

service after May 1, 1973. Prior to that date, surplus water service was charged the same unit variable OMP&R component as entitlement water service. An amendment to the long-term water supply contracts in 1973 significantly changed the rate structure for surplus water service. Capacity and energy costs for pumping surplus and unscheduled water were allocated directly to those water contractors receiving surplus and unscheduled water service. A contract amendment in 1991 again revised the rate structure to provide for payment of costs through a melded power rate. These revisions to charges for surplus and unscheduled water are effective from the date of the amendments and are not applied to past charges.

An interruptible water program was established in 1994. This program is based on individual annual contracts; costs for interruptible water actually delivered are included in *Table B-3*.

Water Conveyance

The water conveyance quantities that form the basis for allocating costs are presented in *Tables B-4, B-5A, B-5B, and B-6*.

Table B-4 presents the schedules of annual entitlements as set forth in *Table A* and Article 6(a) of each water supply contract.

Table B-5A shows amounts of actual and projected entitlement water quantities delivered from each aqueduct reach to each contractor. Projected deliveries for years 2000 through 2035 are based on contractors' requests for future water deliveries. The quantities included in *Table B-5A* also include non-project water delivered to contractors and surplus water deliveries prior to May 1, 1973, and actual interruptible water deliveries in 1994 and after.

Table B-5B presents a summary of actual and projected annual entitlement water quantities delivered or to be delivered to each contractor. The quantities also include amounts of nonproject water and surplus water delivered prior to May 1, 1973, and actual deliveries of interruptible water in 1994 and after.

Table B-6 summarizes the annual entitlement water quantities conveyed or to be conveyed through each

aqueduct pumping plant or power plant for each of the following functions:

- *Deliveries-Water Supply.* Water made available to contractors at down-aqueduct delivery structures, including certain hypothetical quantities to facilitate cost allocations, for those years when deliveries are made from net annual storage withdrawals. The net annual amounts of storage withdrawals are hypothetically added to the actual amounts conveyed from the Delta to the reservoirs, since deliveries made from storage withdrawals bear the same variable OMP&R costs per acre-foot as they would if the deliveries were actually conveyed from the Delta in that year. The hypothetical increases in the deliveries made from reservoir storage withdrawals are offset by equal credits to the minimum OMP&R costs of the respective reservoirs. Thus, the variable OMP&R components per acre-foot (Table B-17) may be applied to the total annual quantities delivered either from aqueduct reservoir storage or from the Delta.
- *Initial Fill Water.* Water required for initial filling of down-aqueduct reaches and reservoirs or for repayment of pre-consolidation water used during construction.
- *Deliveries-Recreation.* Water delivered to down-aqueduct recreation developments or used for fish and wildlife mitigation or enhancement.
- *Operational Losses.* Water lost through evaporation and seepage from all down-aqueduct reaches.
- *Reservoir Storage Changes.* Water placed in down-aqueduct reservoir storage after initial filling of the reservoirs, including projected net annual storage accretions (positive values) and withdrawals (negative values) for all down-aqueduct reservoirs of the Project Transportation Facilities.

Those variable OMP&R costs (Table B-12) that are allocable to storage accretions are assigned to the minimum OMP&R costs of the respective reservoirs. With the exception of Banks Pumping Plant, “Reservoir Storage Changes” also includes SWP water placed into Southern California groundwater storage from 1978 through 1982 (as positive amounts); and water withdrawn from storage and delivered to contractors in 1979, 1982, 1987, 1988, and 1989

(as negative amounts). At Banks Pumping Plant, groundwater additions and withdrawals are included in “Conservation Water.”

Table B-6 also summarizes the following two amounts under the heading “Conservation Water” (Column 25):

1. Net annual water amounts stored and projected to be stored in San Luis Reservoir; and
2. Water lost and projected to be lost through evaporation and seepage from San Luis Reservoir and from the water conservation portion of the California Aqueduct.

“Conservation Water” includes initial fill water, operational losses, and net annual storage changes associated with San Luis Reservoir and the portion of the California Aqueduct that is allocated to conservation. The same allocation procedure outlined above for Transportation Facilities also applies to water delivered from storage in Conservation Facilities, except that the hypothetical cost increases are added to the variable OMP&R cost to be reimbursed through the Transportation Charge and deducted from the minimum OMP&R costs to be reimbursed through the Delta Water Charge.

San Luis Reservoir is operated to conserve water for future delivery to downstream contractors. To account for costs associated with reservoir storage, those power and replacement costs of Banks Pumping Plant (a joint Transportation-Conservation Facility) that are allocated to the conveyance of annual conservation water quantities are transferred to the capital costs of San Luis Reservoir (during initial fill) or to the minimum OMP&R costs of San Luis Reservoir (subsequent to initial fill).

In years of net storage withdrawal from San Luis Reservoir, a portion of the minimum OMP&R cost of the reservoir is transferred to the variable OMP&R cost of Banks Pumping Plant. That transfer is equal to the variable OMP&R cost per acre-foot of delivery through Banks Pumping Plant for that year, multiplied by the acre-feet of deliveries derived from San Luis Reservoir storage for that year. Table B-6 also includes amounts of nonproject water and surplus

water delivered prior to May 1, 1973, and actual deliveries of interruptible water in 1994 and after.

Bases for Reimbursable Costs

This section describes the methods used to derive the costs allocated by the procedures outlined in the preceding section. A diagram of the cost derivation process is shown in the upper-left quadrant of Figure B-1.

First, the capital and minimum OMP&R costs of all SWP facilities are allocated among the various project purposes according to the allocation percentages in Table 1. Those percentages may be subject to revision in the future.

The redeterminations in this appendix involve only the SWP costs that are allocated to water supply and power generation.

Capital Costs

Capital costs used in the redeterminations in this appendix reflect prices prevailing on December 31, 1999; future cost escalation will be reflected in subsequent bulletins.

Table B-7 presents a reconciliation of estimated total capital costs of each Project Conservation Facility and each Project Transportation Facility. This table shows the relationship of Project Conservation and Transportation costs allocated to contractors (Tables B-8, B-9, B-10, and B-13) to the total SWP capital costs projected by the Department.

Table B-8 shows costs incurred and projected to be incurred by the State in connection with each contractor's turnouts. Costs incurred by the State for both State-constructed and contractor-constructed delivery structures are paid directly by the contractors for which the structures are built. (The State incurs design review and construction inspection costs in connection with contractor-constructed turnouts.)

Table B-9 lists costs and payments for excess capacity built into SWP Transportation Facilities according to amendments to contracts with Metropolitan Water District of Southern California, San Gabriel

Valley Municipal Water District, and Antelope Valley-East Kern Water Agency as follows:

1. Additional costs incurred by the State for requested excess capacity;
2. Advances by water contractors of funds for such costs; and
3. Credits for advances in excess of costs, which were applied to respective contractors' installments of the capital cost component of the Transportation Charge in 1981.

Under Amendment 2 of MWD's contract, 809 cfs of excess capacity was originally constructed in reaches of the West Branch at MWD's request. That capacity was reclassified as basic capacity of SWP Transportation Facilities under Amendment 7. MWD paid \$16.3 million as a prepayment of the capital cost component of the Transportation Charge in lieu of advancing funds for the original requested capacity.

Amendment 5 to MWD's contract requires that additional costs for modifications to the Santa Ana Pipeline (required for enlargement of Lake Perris) will be allocated to MWD and returned to the State through payments of the Transportation Charge. The additional costs to be repaid through MWD's capital cost component for the aqueduct reach from Devil Canyon Power Plant to Barton Road total about \$6.7 million (see Bulletin 132-72, page 98).

Table B-10 presents the actual and projected annual capital costs of each aqueduct reach that will eventually be returned to the State, with interest, through contractors payments of the capital cost component of the Transportation Charge and payment of debt service under the Devil Canyon-Castaic contracts.

Annual Operating Costs

Annual operating costs allocable to water supply and power generation are returned to the State through the minimum and variable OMP&R components of Delta Water and Transportation Charges and through a portion of the revenues from energy sales. All reimbursable operating costs of Conservation Facilities are included in the minimum OMP&R component of the Delta Water Charge.

^a Percentages indicated are applicable to the remaining costs of division after excluding costs allocated to flood control that are reimbursed by the federal government (22 percent of capital costs) and excluding specific power costs of Hyatt and Thermalito Power Plants and switchyards. ^b Percentage indicated consists of 48.8 percent of costs allocated to recreation and 26.8 percent to flood control. ^c Percentage indicated consists of 44.9 percent of costs allocated to recreation and 33.1 percent to flood control.				

Transportation and Devil Canyon-Castaic Contract Costs

Table B-11 shows the amounts of the actual and projected costs to be reimbursed through payments of the minimum OMP&R component of the Transportation Charge and allocated operating costs under the Devil Canyon-Castaic contract. The table includes the following seven types of operating costs incurred annually that do not vary with water quantities delivered to the contractors:

1. All direct labor charges for field operation and maintenance personnel, including associated indirect costs;
2. A distributed share of general operating costs that cannot be identified solely with one facility or aqueduct reach;
3. Electric power transmission and station service costs allocable to aqueduct pumping and power recovery plants;
4. All costs for equipment, materials, and supplies;
5. Portions of the power and replacement costs of all up-aqueduct pumping plants and power plants that are allocable to the annual conveyance of water lost to evaporation and seepage from

respective aqueduct reaches or placed into storage in respective reservoirs of the Project Transportation Facilities (after initial fill);

6. Credits, which offset those costs in (5) above, for deliveries drawn from reservoir storage; and
7. Escalation of projected operating costs at 5 percent per year for 2000, 2001, and 2002.

Table B-12 shows the portions of variable OMP&R costs in *Table B-3* that are allocable to the water supply delivery quantities included in *Table B-6* and reimbursed through payments of the variable OMP&R component of the Transportation Charge.

The following five adjustments are made to the *Table B-3* costs to derive the *Table B-12* costs:

1. Part of the variable OMP&R costs of each plant is allocated to recreation. The allocation to recreation is in proportion to the quantity of water conveyed through each plant each year for delivery to on-shore recreational developments.
2. That portion of variable plant costs attributable to the initial fill of aqueduct reaches is allocated to the joint capital costs of respective down-aqueduct reaches and reservoirs.
3. That portion of costs attributable to evaporation and seepage is allocated to the joint minimum OMP&R costs of respective down-aqueduct reaches and reservoirs.
4. Adjustments are made for additions or withdrawals from storage in aqueduct reservoirs. In years when water is added to storage in aqueduct reservoirs, the cost of conveying this water into storage is charged to the minimum OMP&R costs of the corresponding reservoir. In years when storage in aqueduct reservoirs is decreased for the purpose of making deliveries, a credit is applied to the minimum OMP&R costs of the reservoir from which the storage is released. This credit is equal to the number of acre-feet of storage reduction times the variable OMP&R unit rate for the year storage is released. The unit rate is equal to the variable OMP&R unit rate for the year the water is taken from storage.

5. That portion of costs attributable to pumping water to replace evaporation and seepage losses and for additions or withdrawals from storage in San Luis Reservoir is charged to the minimum OMP&R component of the Delta Water Rate.

The remaining costs are allocated to Transportation water supply and repaid by the contractors.

Conservation Capital and Operating Costs

Table B-13 is a summary of actual and projected capital and operating costs of the initial Project Conservation Facilities. These costs are reimbursed through payments by contractors under the Delta Water Charge, Oroville power sales, and Gianelli Generating Plant credits. *Table B-13* also shows credits applied to the reimbursable capital costs of the Project Conservation Facilities according to negotiated settlements concerning incurred planning costs for the period from 1952 through 1978.

Project Water Charges

This section describes the redetermination of past and projected components of the Transportation Charge for annual revision of *Tables C* through *G* of each water supply contract. This section also describes the derivation of the unit Delta Water Rates and the Water System Revenue Bond Surcharge.

A summary of equivalent unit charges for each acre-foot of entitlement water service is also included for each contractor and each aqueduct reach. A diagram of all calculations may be found in the lower half of *Figure B-1*.

Transportation Charges

The accumulation of allocated costs of each aqueduct reach to each contractor is the basis for the Transportation Charge components.

Table B-14 summarizes each contractor's share of the capital costs of aqueduct reaches presented in *Table B-10*. Those amounts are determined by applying proportionate-use ratios set forth in *Table B-1* to the costs in *Table B-10*. The resulting allocated costs are set forth in *Table C* of the respective water supply contracts.

Prepayments of the capital cost component, required under MWD’s Amendment 7, are included as negative capital costs in Table B-14 and Table C of MWD’s Statement of Charges. Solano County Water Agency, Empire West Side Irrigation District, and Castaic Lake Water Agency also prepaid capital costs (see Table B-14 footnotes). Table B-14 includes costs of the planned East Branch Extension to provide water service to San Bernardino Valley Municipal Water District and San Geronio Pass Water Agency.

Both Table B-14 and Table C of the six contractors for project water service below Devil Canyon Power Plant and Castaic Power Plant include the capital costs reimbursable under the Devil Canyon-Castaic contract.

Table B-15 summarizes capital cost components of the Transportation Charge for each contractor for each year of the project repayment period. By the year 2035, the capital cost components shown in Table B-15 will recover the costs shown in Table B-14, with interest at the Project Interest Rate of 4.615 percent per annum and based on the amortization schedules included in Table 2.

Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table D of the water supply contracts. Costs of excess capacity are billed separately and are not included in Table B-15.

Table B-15 includes the debt service payments due from the six contractors down-aqueduct from Devil Canyon Power Plant and Castaic Power Plant according to terms of the Devil Canyon-Castaic contract.

Table B-16A summarizes the minimum OMP&R components of the Transportation Charge for each year of the project repayment period. Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table E of the respective contracts.

The total amounts included in Table B-16A are determined by applying the proportionate-use ratios in Table B-2 to the reach costs in Table B-11. Table B-16A excludes charges for Off-Aqueduct Power Facilities, which are included separately in Table B-16B. Both Table B-16A and Table E for the six contractors down-aqueduct from Devil Canyon Power Plant and Castaic Power Plant include the

**Table 2

Tulare Lake Basin Water Conservation District	1968 ^e
Ventura County Flood Control District	1964

^a Allocated capital costs of transportation facilities amortized in equal annual installments unless otherwise noted.

^b Principal payments on each annual capital cost prior to 1971 delayed until calendar year 1972, except payments for 1963.

^c For Yuba City and Butte County payments for Delta Water Charge only.

^d Payment deferred for 1963 and added to 1964 payment with accrued interest.

^e For Dudley Ridge Water District, Empire West Side Irrigation District, Kern County Water Agency (agricultural use), Oak Flat Water District, and Tulare Lake Basin Water Conservation District, according to Article 45 of the contracts for supply of agricultural water, capital costs of transportation facilities allocated to agricultural water supply are amortized by using an equivalent unit rate per acre-foot applied to the annual entitlements (Table B-4) through the project repayment period.

^f For San Luis Obispo Flood Control and Water Conservation District and Santa Barbara County Flood Control and Water Conservation District, all principal and interest payments for costs of the Coastal Sub were deferred until 1976.

portion of operating costs payable under the Devil Canyon-Castaic contract.

Prior to 1997, as part of operating agreements with the Department, Kern County Water Agency was billed for any additional operating costs caused by

early installation of units in Las Perillas and Badger Hill Pumping Plants by Berrenda Mesa Water Storage District (see Bulletin 132-71, page 7). Under those agreements, a portion of minimum OMP&R costs of Reach 31A were assigned directly to KCWA, with the remaining reach costs allocated by application of the proportionate-use ratios shown in Table 3. The Department purchased Unit No. 6 at Las Perillas and Badger Hill Pumping Plants in early 1997 to provide pumping capacity for deliveries to Coastal Area contractors, which began in 1997.

Table 3
Minimum OMP&R Costs of Reach 31A

1995	272,341
1996	322,123
Total	3,997,767

Table B16-B summarizes the annual charges for Off-Aqueduct Power Facilities allocated to each water contractor, adjusted for prior overpayments or underpayments of charges. Those charges are to repay all Off-Aqueduct Power costs, including bond service, deposits for reserves, operation and maintenance costs, fuel costs, taxes, and insurance.

Adopted October 1, 1979, the General Bond Resolution requires that sufficient revenues be collected each year to repay all of those costs. In addition, an amount totaling 25 percent of the annual bond service is collected each year to ensure that sufficient funds are available to cover all annual costs. Any revenues collected and not needed during the year are refunded to the contractors in the next year.

Table 4 summarizes Off-Aqueduct Power Facility charges and credits related to deliveries for 1999.

Table 4
Summary of Off-Aqueduct Power Facility
Charges and Credits

1999 Charges	
Reid Gardner Power Plant	\$72,297,265
Bottle Rock Power Plant	\$19,289,709
South Geysers Power Plant	\$7,338,451
Subtotal	\$98,925,425
1999 Credits	
Power sales	\$14,484,887
Miscellaneous water (wheeling)	0
Subtotal	\$14,484,887
Grand Total	\$84,440,538

Table 5 shows projected charges for Off-Aqueduct Power Facilities and an amount equal to 25 percent of annual bond service for 2000 and each year thereafter.

The annual charges for Off-Aqueduct Power Facilities are allocated among contractors in proportion to the electrical energy required to pump entitlement water for the year. The initial allocation for the Statements of Charges is based on estimates of energy to pump requested entitlement water deliveries.

An interim adjustment in the allocation of Off-Aqueduct Power costs may be made in May of each year based on updated cost estimates and April revisions in water delivery schedules. An additional adjustment is made the following year based on actual water deliveries and actual costs for the year.

**Table 5
Projected Charges for Off-Aqueduct Power Facilities**

Year	Total Annual Cost	25% Bond Service
2000	94,328,037	9,507,543
2001	104,414,939	9,507,294

2022	2,167,704	433,541
2023	3,499,204	699,841
2024	3,498,641	699,728

The energy required to pump each contractor’s water is calculated using the kilowatt-hour per acre-foot factors (shown in Table 6) for the pumping plants upstream from the delivery turnouts. The amounts include transmission losses.

Table B-17 presents a summary of actual and projected total variable OMP&R costs for each acre-foot of water conveyed through each aqueduct pumping plant and power plant for each year of the project

**Table 6
Kilowatt-Hour Per Acre-Foot Factors for Allocating Off-Aqueduct Power Facility Costs**

Polonio Pass	705	2,826

^a Includes transmission losses

repayment period. Those data are derived according to the following procedure specified in Article 26(a) of the Standard Provisions for calculating the variable OMP&R component of the Transportation Charge:

- An annual charge per acre-foot of projected water deliveries to all contractors served from or through each reach is determined so the projected variable OMP&R costs to be incurred for each reach will be returned to the State.
- The total annual variable OMP&R component for any contractor for a given reach is obtained by multiplying the unit charge associated with that reach by the quantity of water actually delivered from or through the reach to the contractor.

The data summarized in Table B-17 are derived by dividing the costs shown in Table B-3 by the quantities of water shown in Table B-6. However, certain costs included in Table B-3 for extra peaking service, which would otherwise constitute variable OMP&R

costs, are assigned directly to contractors requesting this type of service (see Bulletin 132-71, page 21, and Water Service Contractors Council Memo No. 593, July 10, 1970). Those costs are excluded from the unit charges shown in Table B-17. Peaking charges based on additional capacity ceased in 1983. Since 1984, costs are based on market energy rates. The amounts of extra peaking charges for additional power costs are shown in Table 7 and Table 8.

The unit rates shown in Table B-17 constitute the rates for the pumping plants and power plants listed. The cumulative rates constitute the total rates, cumulative from the Sacramento-San Joaquin Delta, and are applicable to deliveries from or downstream of the pumping plants and power plants. Extra peaking service costs are excluded.

Table B-18 shows the variable OMP&R components of the Transportation Charge for each contractor for each year of the project repayment period. Table B-18 is developed from the costs per acre-foot included in Table B-17 and the delivery quantities for each contractor from each reach as indicated in Table B-5A, plus any costs for extra peaking service. Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table F of the respective water supply contracts.

Table B-19 summarizes the annual Transportation Charges for each contractor (the sums of the corresponding amounts included in Tables B-15, B-16A, B-16B, and B-18). Those estimated payments, subsequently adjusted for prior overpayments or underpayments, are set forth in Table G of the respective water supply contracts.

Both Table B-19 and Table G for the six contractors down-aqueduct from Devil Canyon Power Plant and Castaic Power Plant include amounts of debt service and operating cost payments due according to provisions of the Devil Canyon-Castaic contract.

Delta Water Charges

Table B-20A presents the calculation of the Delta Water Rate for the initial Conservation Facilities applicable in 2000 according to the amended Articles 22(e) and 22(g) of all 29 contracts. The Delta Water

Rate was calculated at a Project Interest Rate of 4.615 percent based on Conservation Facility costs shown in Table B-13. That Delta Water Rate is used to compute projected Delta Water Charges under Article 53(i) for the contractors who have executed the Monterey Amendment. Included in Table B-20A is the Delta Water Rate for the two contractors who have not executed the Monterey Amendment (Plumas County and Empire).

Table B-20B shows each component of the 2001 Delta Water Rate from Table B-20A.

Table B-21 summarizes the annual Delta Water Charge for each contractor. The projected charges in Table B-21 are developed by multiplying the total rate per acre-foot, as shown in Table B-20A, by the amount of entitlement water for each contractor as shown in Table B-4.

Water System Revenue Bond Surcharge

Table B-22 summarizes the Water System Revenue Bond Surcharge to the Delta Water Charge and the Transportation capital cost component of each contractor. The surcharge shown in Table B-22 includes the financing costs of WSRB Series B through V. This surcharge is levied according to an amendment to the water supply contracts for repaying Water System Revenue Bond financing costs. All long-term water supply contractors signed that amendment.

Total Water Charges

Table B-23 summarizes the total annual charges to each contractor (the sum of the Transportation Charge in Table B-19, the Delta Water Charge in Table B-21, and the Water System Revenue Bond Surcharge in Table B-22). The charges do not reflect past payments by contractors and are unadjusted for prior overpayments or underpayments.

Equivalent Total Water Charges

Table B-24 presents the Transportation Charge and Delta Water Charge in terms of the equivalent unit charge for each acre-foot of entitlement water now projected for delivery to the respective contractors.

These equivalent charges would provide the same principal sum at the end of the project repayment period as annual payments to be made as part of the

Delta Water Charge and Transportation Charge, plus interest at the Project Interest Rate, if applied to each acre-foot of entitlement water delivered to date; all surplus water delivered prior to May 1, 1973; all interruptible water deliveries in 1994 and after; and all entitlement water now projected to be delivered during the remainder of the project repayment period (Table B-5B).

The equivalent unit Delta Water Charges included in Table B-24 are greater than those in Table B-20A because current projections of entitlement water service are less for most contractors than the amounts shown in Table A.

Equivalent Water Costs by Reach

Table B-25 presents a summary of the equivalent unit Transportation cost of conveying entitlement water through respective aqueduct reaches of the Project Transportation Facilities.

Those unit costs provide the basis of charges assessed for extra service (such as for delivery of entitlements down-aqueduct from a contractor's turn-out) and for wheeling service to entities other than the long-term water supply contractors.

The cumulative unit conveyance costs indicated for reaches in Table B-25 do not necessarily equal the equivalent unit Transportation Charges to contractors served from such reaches. The unit charges in Table B-24 account for the rate of water demand buildup and cost allocation factors of the individual contractors; however, the unit costs included in Table B-25 reflect the effect of melding the respective buildups and allocation criteria of all contractors whose entitlements are conveyed through a given reach. Table B-25 also includes surplus water delivered prior to May 1, 1973, and interruptible water deliveries in 1994 and after.

East Branch Enlargement Facility Charges

Table B-26 reflects the Department's projection of annual capital costs of the East Branch Enlargement Facilities for each aqueduct reach. Those projections will be redetermined in future bulletins to include:

- A reallocation of costs of constructing the present East Branch facilities between Alamo Power Plant and Silverwood Lake;
- A reallocation of costs of Silverwood Lake to reflect additional use as a result of East Branch Enlargement operation;
- Reallocation of costs of San Bernardino Tunnel to reflect redistribution of flow capacities necessary for the East Branch Enlargement Facilities; and
- Actual construction costs of the enlargement.

These costs will be recovered with interest from the seven Southern California water contractors participating in the enlargement, according to their amended water supply contracts (see Table 9).

Table B-27 lists the projected minimum OMP&R costs for each reach of the enlargement to be repaid by the seven contractors participating in the East Branch Enlargement. Currently, this table includes only the amounts of estimated incremental minimum OMP&R costs attributable to the East Branch Enlargement. According to Article 49 (e)(1), the contractors participating in the East Branch Enlargement will also share in the remaining minimum OMP&R costs of the affected reaches according to a formula to be developed by the Department in consultation with the affected contractors. Once the formula is developed, subsequent versions of this table will reflect the transfer of a share of the minimum OMP&R costs now included in Table B-11.

Table B-28 shows each participating contractor's share of the estimated capital costs of the East Branch Enlargement shown in Table B-26.

Table B-29 shows the amounts of the annual capital cost components of the East Branch Enlargement Transportation Charge for each participating contractor. This component consists of each contractor's allocated share of debt service on bonds sold to finance the enlargement.

Table B-30 shows the minimum OMP&R components of the East Branch Enlargement Transportation Charge for each participating contractor for each year of the project repayment period. The amounts shown

Table 7

in Table B-30 will recover the minimum OMP&R costs shown in Table B-27.

Table B-31 shows the annual East Branch Enlargement Transportation charges for each participating contractor (the sums of the corresponding amounts included in Table B-29 and B-30).

Short-Term Agreements

The long-term water supply contractors and the Department have executed a short-term agreement that affects the contractors' charges. A 5-year agreement was executed in late 1997 between the Department and 16 Municipal and Industrial contractors, who agreed to pay their allocated shares of Municipal Water Quality Investigations costs. The MWQI charges under this agreement are included in the

Transportation minimum OMP&R components shown in Table B-16A.

Nine contractors have executed short-term agreements to participate in the feasibility study for the American Basin conjunctive use program. The costs of the feasibility study are included in Table B-16A.

a) Power costs for the period 1968 through 1987 are for an interim facility.
 b) The costs of Del Valle Pumping Plant are combined with those of South Bay Pumping Plant to simplify the cost allocations.

Table B-3
Power Costs and Credits and Annual Replacement Deposits for Each
Aqueduct Pumping and Power Recovery Plant

a) Entitlements for the South Bay Area were supplied by non-Project water for the period June 1962 through November 1967. Actual delivery quantities of Project water are shown for 1967.
b) District's Table A quantities exclude amounts during the period 1968 through 1987 that were supplied by non-Project water.

Table B-4
Annual Entitlements to Project Water
(Acre-Feet)

Calendar Year	San Joaquin Valley Area								Total (19)
	Dudley Ridge Water District (11)	Empire West Side Irrigation District (12)	Kern County Water Agency			County of Kings (16)	Oak Flat Water District (17)	Tulare Lake Basin Water Storage District (18)

d) In accordance with the Exchange Agreement between the noted agencies, MWD assumed responsibility for payment of variable OMP&R costs on the exchange water in reaches beyond Reach 22B, and Desert Water Agency and Coachella Valley Water District for such costs from the Delta through Reach 22B. The adjustment in deliveries in Reach 22B provides for compliance with provisions for the repayment of costs under the agreement. In 1993 and after the exchange takes place in Reach 26A.

e) 1988 advance entitlement.

f) In accordance with the Exchange Agreement between the noted agencies, MWD assumed responsibility for payment of variable OMP&R costs on the exchange water in reaches beyond Reach 22B, and Desert Water Agency and Coachella Valley Water District for such costs from the Delta through Reach 22B.

The adjustment in deliveries in Reach 22B provides for compliance with provisions for the repayment of costs under the agreement. In 1993 and after the exchange takes place in Reach 26A.

a) Miscellaneous project receipts that are applied for accounting purposes to reduce the capital costs of the particular facilities.
b) These allowances are included for planning the future financial program, but not for determining current water charges.
The costs shown in this appendix are based on prices prevailing on December 31, 1998.
c) See Table B-8.
d) See Table B-9.
e) See Table B-13. A portion of these costs will be offset by power generation sales and credits. Planning and Pre-operation line item includes \$50,534.00 of planning costs financed from Systems Revenues and not included in Table 14-3. Oroville Division total reduced by \$14,095,000 for costs included under Small Hydro.
f) See Table B-10. Mojave Division total reduced by \$76,069,000 for costs included under Small Hydro.

a) Overpayment or underpayment for each calendar year - column (1) minus column (2).
b) Interest rates shown are annual rates. Interest is credited daily at applicable rates on funds deposited in the State's Surplus Money Investment Fund.
c) Amounts shown are end-of-year balances. Interest on overpayments is credited at applicable Surplus Money Investment Fund Interest Rates shown in columns (4) and (5). Interest on underpayments is charged at the 1980 Project Interest Rate of 4.584 percent.

d) Actual payments are shown for 1965 through 1976, with 1981 adjusted to reflect overpayments and underpayments without interest for prior years.
e) Interest for overpayments and underpayments under provisions of Amendment 2 of the contract.
f) Actual payments are shown for 1965 through 1973, with 1974 adjusted to reflect overpayments and underpayments without interest for prior years.
g) Interest for overpayments and underpayments under provisions of Amendment 5 of the contract.
h) Amounts in excess of incremental costs, under the provisions of the contract, reduce the Transportation Charge capital cost component of the Agency's Statement of Charges for January 1981.

a) Includes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."

b) Costs for the period 1968 through 1987 are for an interim facility.

c) The relatively minor costs of Del Valle Pumping Plant have been combined with those of South Bay Pumping Plant to simplify the allocation procedures.

Table B-12

Variable OMP&R Costs to Be Reimbursed through Variable OMP&R Component of Transportation Charge (a

(Dollars)

d) These values represent a proportionate allocation of the total variable OMP&R costs of pumping and recovery plants (Table B-3) associated with net annual withdrawals from storage for Project Transportation Facilities. The allocation is determined annually by applying the following ratio, calculated from the data shown in Table B-6: "Reservoir Storage Changes" (withdrawals, as a positive value) conveyed through each plant, divided by "Total" annual quantity conveyed through each plant, in acre-feet. The costs so determined are accumulated for all upstream plants for each year, for each respective reservoir.

Table B-12

**Variable OMP&R Costs to Be Reimbursed through Variable OMP&R
Component of Transportation Charge (a)**
(Dollars)

a) Reimbursed through the capital cost component of the Delta Water Charge.

b) Negotiated settlements as to the magnitude of SWP planning costs from 1952 through 1978.

c) Reimbursed through the minimum OMP&R component of the Delta Water Charge. Credits for Gianelli power generation are reflected in these net costs.

d) Revenues credited through the capital cost component of the Delta Water Charge.

e) Revenues credited through the minimum OMP&R component of the Delta Water Charge.

f) Under amendments of Articles 22(e) and 22(g), planning and pre-operating costs of additional Project Conservation Facilities incurred through the previous year (1999) are deducted in the Delta Water Charge.

a) For the period 1968 through 1987, rates are for an interim facility.

b) The relatively minor costs of Del Valle Pumping Plant have been combined with those of South Bay Pumping Plant to simplify the allocation procedure.

Table B-17
Unit Variable OMP&R Component of Transportation Charge
(Dollars per Acre-Foot)

Calendar Year	California Aqueduct (continued)									
	Reach 4		Reach 14A		Reach 15A		Reach 16A		Reach 17E	
	Dos Amigos Pumping Plant		Buena Vista Pumping Plant		Teerink Pumping Plant		Chrisman Pumping Plant		Edmonston Pumping Plant

Table B-20A
Calculation of Delta Water Rates

Calculation in accordance with Article 53(i) of the Monterey Amendment

(Values in millions of dollars [\$] or in millions of acre-feet [AF] discounted to 2000 at 4.615 percent per annum)

<i>Procedure</i>	<i>Capital Cost Component (1)</i>		<i>Minimum Operation Maintenance, Power and Replacement Component (a (2)</i>		<i>Total Delta Water Rate (3)</i>	
Commencing in 2001 Total Costs of "Initial" Project Conservation Facilities to be Reimbursed and Project Water Entitlements during the Project Repayment Period	\$3,567.43 b)	226.85 AF	\$2,221.02 c)	226.85 AF	\$5,788.45	226.85 AF
Less, Project Power Revenues to be Realized During the Project Repayment Period	(1,322.53)		(413.91)		(1,736.44)	
Less, Delta Water Charges Paid and Project Water Entitlements, Prior to 2001	(1,410.97) d)	(155.23) AF	(925.45)	(155.23) AF	(2,336.42)	(155.23) AF
Total	\$833.93	71.62 AF	\$881.66	71.62 AF	\$1,715.59	71.62 AF
Rate Applicable in 2001	\$11.64	per acre-foot	\$12.31	per acre-foot	\$23.95	per acre-foot

Calculation under original provisions, without the Monterey Amendment

(for Plumas County and Empire)

<i>Procedure</i>	<i>Capital Cost Component (1)</i>		<i>Minimum Operation Maintenance, Power and Replacement Component (a (2)</i>		<i>Total Delta Water Rate (3)</i>	
Commencing in 2001 Total Costs of "Initial" Project Conservation Facilities to be Reimbursed and Project Water Entitlements during the Project Repayment Period	\$3,556.85b)	226.85	\$2,212.54 c)	226.85	\$5,769.39	226.85
Less, Project Power Revenues to be Realized During the Project Repayment Period	(1,322.53)		(413.91)		(1,736.44)	
Less, Delta Water Charges Paid and Project Water Entitlements, Prior to 2001	(1,410.97) d)	(155.23) AF	(925.45)	(155.23) AF	(2,336.42)	(155.23) AF
Total	\$823.35	71.62 AF	\$873.18	71.62 AF	\$1,696.53	71.62 AF
Rate Applicable in 2001	\$11.50	per acre-foot	\$12.19	per acre-foot	\$23.69	per acre-foot

a) Considering that all operating costs of Project Conservation Facilities will not vary with annual amounts of Project water delivered, and therefore are properly classified as "Minimum" OMP&R Costs.

b) Including net credits of \$4,850,000 for settlements as to the magnitude of Project Capital costs incurred prior to December 31, 1960, and net credits of \$6,678,320 for settlement as to the magnitude of Project Capital costs incurred during the 1961 through 1978 period.

c) Includes conservation power costs and credits at San Luis.

d) Applying all Delta Water Charges paid prior to 1970 to reimburse Capital costs (the charge was not divided into components until 1970).

Table B-20B
Delta Water Rates by Facility
(Dollars per Acre-Foot)

<i>Item</i>	<i>Capital Cost Component (1)</i>	<i>Minimum Operation, Maintenance, Power and Replacement Component (2)</i>	<i>Total Delta Water Rate (3)</i>
Initial Conservation Facilities			
Oroville Division			
Water Supply and Power Costs (a)	30.73	16.21	46.94
Less, Oroville Power Revenues	-18.46	-5.78	-24.24
<i>Subtotal</i>	12.27	10.43	22.70
Delta Facilities (b)	8.63	7.82	16.45
California Aqueduct, portion			
Reach 1	1.97	2.97	4.94
Reach 2A	1.18	0.55	1.73
Reach 2B	0.60	0.26	0.88
Reach 3	0.40	0.17	0.57
<i>Subtotal</i>	4.15	3.97	8.12
San Luis Facilities	5.92	3.59	9.51
Planning and preoperating costs through 1999	1.73	0.00	1.73
45,000 AF relinquished costs	0.15	0.12	0.27
Less, Capital Cost Credits	-0.79	0.00	-0.79
Less, Delta Water Charges paid prior to 2001	-20.42	-13.62	-34.04
Rate applicable in 2001	11.64	12.31	23.95

a) Includes revenue received from non-contractors.

b) Includes (1) Delta Facility planning costs, (2) Delta Studies costs, and (3) Suisun Marsh Facilities Costs.

- a) Representative of transportation unit costs only; does not include a unit cost of conservation. The Delta Water Rate should be added to these values in order to approximate unit costs at canal-side. Includes surplus water prior to May 1, 1973.
- b) Hypothetical charges which, if assessed on all entitlement water delivered to date, all surplus water delivered prior to May 1, 1973, and all entitlement water now estimated to be delivered during the remainder of the Project repayment period (Table B-5B), would provide a sum at the end of the period financially equivalent to all Transportation Charges required under the water supply contract considering interest rate at the Project Interest Rate of 4.615 percent per annum.
- c) The Water System Revenue Bond Surcharge equivalent unit rate is calculated by dividing the WSRB surcharge for 2001 (from 132-00, Table B-22) by the total Transportation Capital (132-00, B-15) and the Capital component of the Delta Water Charge (132-00, B-4 * 11.77671248). This rate is multiplied by the equivalent rate for the Transportation Capital cost (column 1).

Table B-26

**Capital Costs of Each Aqueduct Reach to Be Reimbursed
through the Capital Cost Component of the East Branch Enlargement
Transportation Charge**

a) Presently, this table shows only the estimated incremental minimum OMP&R costs attributable to East Branch Enlargement. Under Article 49(e)(1), the contractors participating in the East Branch Enlargement will also share in the remaining minimum OMP&R costs of the affected reaches according to a formula to be developed by the Department in consultation with the affected contractors. Once the formula is developed, subsequent versions of this table will reflect the transfer of a share of the minimum OMP&R costs presently shown in Table B-11.

Table B-27

a) Under Article 49(d)(4)(A) of its contract, San Bernardino Valley Municipal Water District elected to pay a portion of its allocated costs of East Branch Enlargement in advance rather than to participate in payment of Water System Revenue Bonds. This election made via a letter of agreement signed June 1, 1987. As of June 1999, \$6,347,938 has been received from the San Bernardino Valley Municipal Water District.

Temperature	degrees Fahrenheit (°F)	degrees Celsius (°C)	(°F - 32)/1.8	(1.8 x °C) + 32

- When using "dual units," inches are normally converted to millimeters (rather than centimeters).
- Not used often in metric countries, but is offered as a conceptual equivalent of customary western U.S. practice (a standard depth of water over a given area of land).
- ◆ ASTM Manual E380 discourages the use of billion cubic meters since that magnitude is represented by giga (a thousand million) in other countries. It is shown here for potential use for quantifying large reservoir volumes (similar to million acre-feet).

OTHER COMMON CONVERSION FACTORS

1 cubic foot=7.48 gallons=62.4 pounds of water	1 acre-foot=325,900 gallons=43,560 cubic feet
1 cubic foot per second (cfs)=450 gallons per minute (gpm)	1 million gallons=3.07 acre-feet
1 cfs=646,320 gallons a day=1.98 ac-ft a day	1 million gallons a day (mgd)=1,120 ac-ft a year
