STATE OF CALIFORNIA
Department of Water Resources
SACRAMENTO

December 18, 1957

Honorable Goodwin J. Knight, Governor, and
Members of The Legislature of The
State of California

State Water Pollution Control Board

Gentlemen:

I have the honor to transmit herewith a report on the quality of surface waters in California. This is the second in a series of reports concerning this important matter.

In April, 1951, this Statewide Stream Sampling Program was initiated at the request of the State Water Pollution Control Board, and since that time has been conducted by the Department of Water Resources, as authorized by Section 229 of the Water Code in cooperation with the State Department of Public Health, Bureau of Sanitary Engineering, the State Department of Fish and Game, and with various other agencies and individuals. Its objective is to secure data on prevailing quality of water in the major streams and lakes of California. These data are utilized by the Department of Water Resources in conducting water resources development studies and implementing The California Water Plan, by the regional water pollution control boards in establishing waste discharge requirements for protection of surface waters in California and by other water service agencies throughout the State.

This report covers the period January, 1955 through December, 1956, and presents monthly analyses of water from 150 sampling points.

Very truly yours,

A handwritten signature in cursive script that reads "Harvey O. Banks".

HARVEY O. BANKS
Director

DEPARTMENT OF HEALTH, EDUCATION AND WELFARE
OFFICE OF THE ASSISTANT SECRETARY FOR PUBLIC AFFAIRS
WASHINGTON, D.C. 20462

FOR IMMEDIATE RELEASE

Washington, D.C., [Date]

[Faded body text, likely containing the main announcement or report]

[Faded text at the bottom of the main body, possibly a closing or signature line]

[Faded signature and name block]

ACKNOWLEDGMENT

The extensive coverage of the Statewide Stream Sampling Program is made possible through the cooperation of state, local and federal agencies. Through the coordinated efforts of these agencies, this sampling program encompasses the monthly collection of about 150 water samples throughout the state.

The helpful cooperation of the following agencies is gratefully acknowledged:

United States Corps of Engineers

United States Geological Survey

California Disaster Office, Radiological Services

State Department of Fish and Game

State Department of Public Health, Bureau of Sanitary Engineering

State Department of Public Health, Division of Laboratories

State Water Pollution Control Board

Los Angeles County Flood Control District

Ventura County, Department of Public Works

City of Los Angeles, Health Department

City of Los Angeles, Department of Water and Power

City of San Bernardino

City of San Francisco

City of Long Beach, Department of Public Health

Kern County Canal Company

Kings River Water Association

Metropolitan Water District of Southern California

Office of the Watermaster, Truckee and Carson Rivers

Truckee-Carson Irrigation District

ORGANIZATION

STATE DEPARTMENT OF WATER RESOURCES

DIVISION OF RESOURCES PLANNING

Harvey O. Banks Director of Water Resources
M. J. Shelton Deputy Director of Water Resources
William L. Berry Chief, Division of Resources Planning
Carl B. Meyer Chief, Special Activities Branch

The activity under which this report has been
prepared is directed by

Meyer Kramsky Principal Hydraulic Engineer

The activities in northern California are under the
supervision of

Willard R. Slater Supervising Hydraulic Engineer

The activities in southern California are under the
direction of

Max Bookman District Engineer

and the supervision of

David B. Willèts Supervising Hydraulic Engineer

This report was prepared by

Carleton E. Plumb Senior Hydraulic Engineer
Eldon E. Rinehart Associate Hydrographer
Robert F. Clawson Associate Hydraulic Engineer
Robert B. Gunderson Assistant Hydraulic Engineer

Assisted by

- Harold V. Willshon Junior Civil Engineer
- Allan Joy Junior Civil Engineer
- Lloyd P. Olsem, Jr. Engineering Aid II
- Shigeru Katsumata Engineering Aid I
- Ross Mathews Engineering Aid I

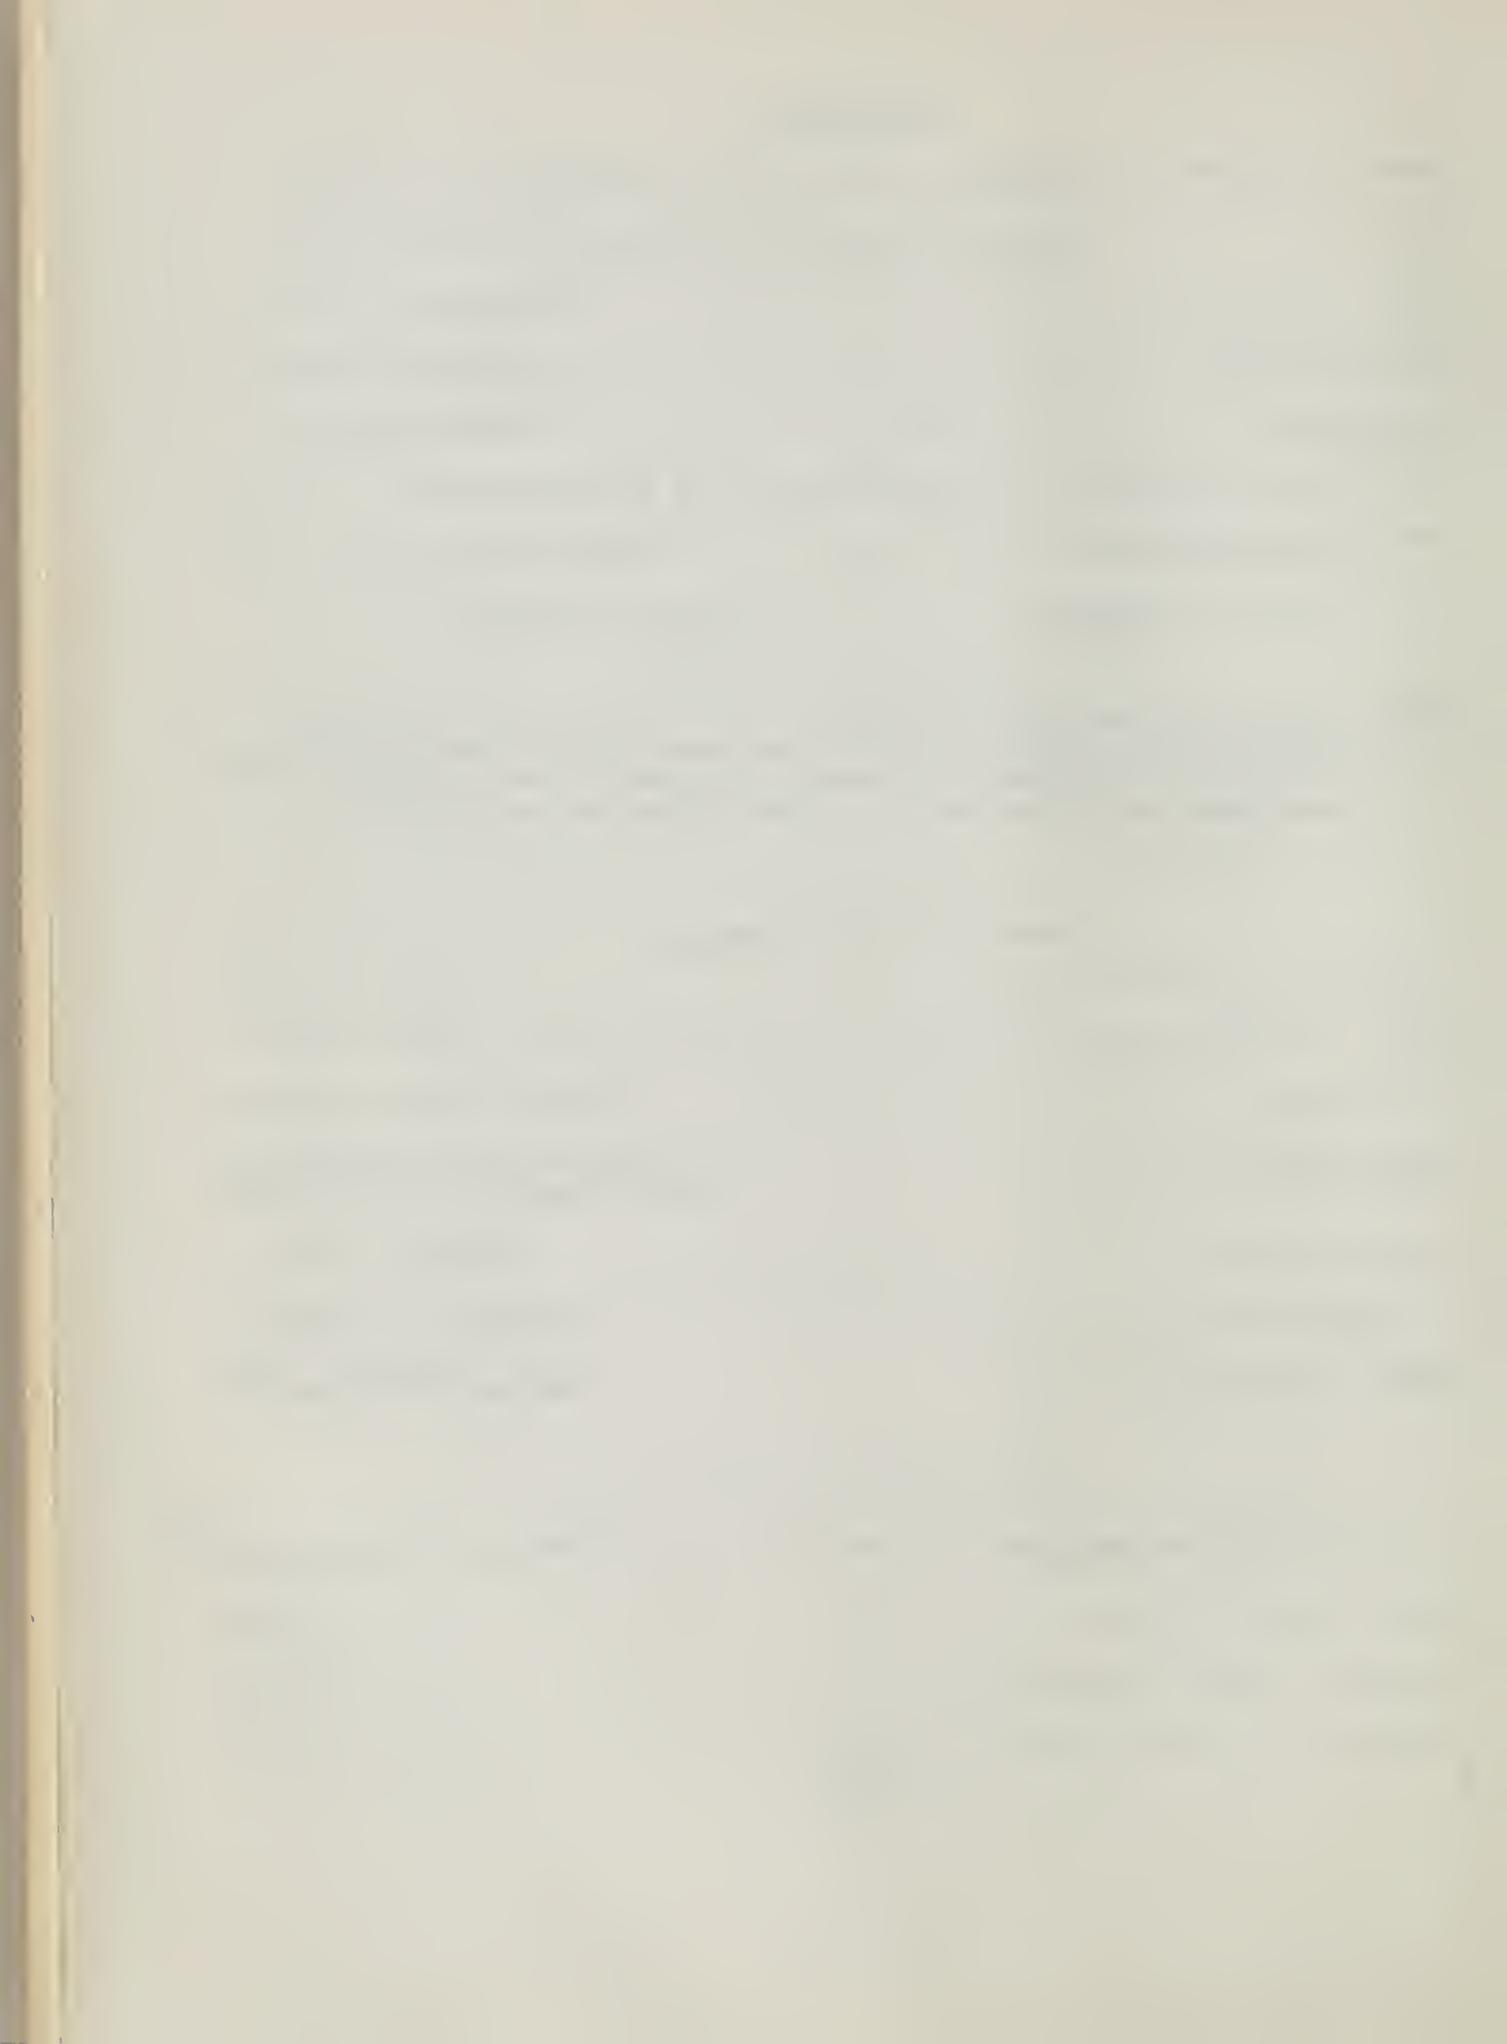

- Paul L. Barnes . . . Chief, Division of Administration
- Porter Towner Chief Counsel
- Isabel C. Nessler Coordinator of Reports

NOTE: Pursuant to Chapter 52, Statutes of 1956, effective July 5, 1956, the Department of Water Resources succeeded to all of the functions, duties and responsibilities formerly assigned to the Division of Water Resources. The Division of Water Resources was organized as follows:

DIVISION OF WATER RESOURCES

- Harvey O. Banks* State Engineer
- L. C. Jopson Assistant State Engineer
- Carl B. Meyer Principal Hydraulic Engineer
Chief - Water Quality Function
- Henry Holsinger Principal Attorney
- T. R. Merryweather Administrative Officer
- Isabel C. Nessler Coordinator of Reports

*A. D. Edmonston was State Engineer until his retirement on November 1, 1955.

CHAPTER I INTRODUCTION

In California, as elsewhere, agricultural, industrial, and urban water uses contribute significant amounts of waste to surface and underground supplies. In some instances these wastes are harmful or potentially so as to the State's water resources. The early detection and control of water quality degradation is imperative if the fullest practicable beneficial uses are to be made of the available supplies.

In order to secure the data necessary to protect and monitor the quality of the State's surface water supplies, a continuing stream sampling program was initiated in April, 1951, at the request of the State Water Pollution Control Board. This program has since that time been conducted by the Department of Water Resources in cooperation with various agencies and individuals. A similar program to monitor the mineral quality of ground water in important basins throughout the State was begun in 1953.

The stream sampling program reported herein comprises the monthly collection of water samples from surface streams throughout the State. Monthly reports of mineral analyses of these samples are published by the Department of Water Resources following receipt of the analyses from the laboratories and distributed to cooperating and interested agencies.

This is the second of a series of reports presenting water quality data collected under this program for major streams and lakes of California and covers the period January, 1955, through December, 1956. These reports summarize the data published in the monthly reports and present a brief evaluation of the mineral characteristics of the sampled waters.

Authorization

The stream sampling program reported herein is authorized by Section 229 of the Water Code. This section, as amended, directs that:

"The Department of Water Resources shall investigate conditions of the quality of all waters within the State, including saline waters, coastal and inland, as related to all sources of pollution of whatever nature and shall report thereon to the Legislature and to the appropriate regional water pollution control board annually, and may recommend any steps which might be taken to improve or protect the quality of such waters."

Purpose and Scope

The general objectives of the surface water sampling program are: (1) to secure information on present or prevailing quality of water in the major streams and lakes throughout the State of California; (2) to secure data useful for evaluating salt balance conditions; and (3) to provide a continual check on quality of water. These data provide a basis for determination of the water quality aspects of the California Water Plan and other water resources developments.

At present the program entails analyses of water samples collected at monthly intervals from 150 sampling stations located on 90 major California streams and lakes as shown on Plate 1. The ultimate objective of the program is to secure continuous and reliable water quality data at a network of sampling stations located so as to represent practically all of the surface drainage of California, both above and below present or potential sources of pollution or degradation. Water analyses made in connection with this program include mineral, radiological and bacterial tests.

This report presents a brief discussion and generalized appraisal of the mineral characteristics of surface water throughout the State. In the future, it is anticipated that subsequent reports will be greatly expanded to include a detailed appraisal of water quality characteristics for each stream from which water samples are obtained. This detailed appraisal will include: (1) a discussion of the mineral, radiological and bacterial characteristics; (2) enumeration and discussion of major waste discharges on each stream covered in the program; and (3) evaluation of significant changes in quality detected during the reporting period. Additional sampling stations will be added to the program as conditions dictate and time and availability of funds permit.

Field Methods and Procedures

Agencies participating in the field sampling program are listed below together with the number of stations sampled monthly by each agency:

<u>Agency</u>	<u>Number of Stations Sampled</u>
Department of Water Resources	114
Department of Public Health, Bureau of Sanitary Engineering	24
Department of Fish and Game	1
United States Corps of Engineers	4
Metropolitan Water District of Southern California	2
City of San Bernardino	2
City of Los Angeles, Department of Water and Power	1
City of Los Angeles, Health Department	1
City of Long Beach, Department of Public Health	<u>1</u>
TOTAL	150

Water samples are collected each month for mineral analysis and bacterial examination. In addition, samples are collected twice a year for radiological assay. Samples obtained for bacterial examination are kept in the field in portable ice boxes while in transit to the laboratory for examination.

In addition to collecting the above described samples, sampling personnel make field determinations of dissolved oxygen (DO) by use of the Modified Winkler Method. Determination of water temperature and pH is also made at point of collection and physical conditions of the water from visual inspection are noted.

Nearly all of the sampling stations are situated at or near stream gaging stations and gage heights are recorded at the time the water samples are collected. Instantaneous stream discharges at the time of sample collection are subsequently obtained.

Laboratory Methods and Procedures

Complete mineral analyses, including the determination of heavy metals and radiological assays are performed on samples collected usually in May and September, because it is during these spring and fall months that extremes in flow conditions usually occur. Partial mineral analyses of water samples collected in the remaining months are deemed sufficient to permit detection of any significant variation in mineral character of the water. Duplicate bacterial examinations are performed on samples collected monthly throughout the entire year.

Mineral analyses and determination of heavy metals are performed by the Water Quality Branch of the United States Geological Survey, and by

the Department of Water Resources laboratories located in Sacramento, San Bernardino, and Riverside. Radiological assays are performed by the California Disaster Office radiological laboratory in Sacramento, and bacterial examinations are made by the California Department of Public Health, Division of Laboratories, in Berkeley and Los Angeles.

The procedures used in radioassays of stream samples are described in the California Disaster Office communication shown in Appendix B.

Methods of mineral and bacterial analyses in general are those described in the American Public Health Association publication entitled "Standard Methods for the Examination of Water and Sewage" 10th Edition, 1955. In some cases, the methods described in the following publications also have been employed: (1) U. S. Geological Survey, "Methods of Water Analysis", 1950. California Department of Public Works, Division of Water Resources, "Methods of Analysis", October, 1955.

The following tabulation indicates the constituent analyzed for in the various types of analyses performed in connection with this program.

Constituent	Analyses			
	: Complete	: Partial	:	:
	: mineral	: mineral	: Bacterial	: Radiological

Water Quality Criteria

Criteria currently used by the Department of Water Resources to determine acceptability of water for the most common beneficial uses are described hereinafter. In general the values presented herein should be considered only as guides to judgment, and not as absolute limiting standards.

Criteria for Drinking Water

Water that is used for drinking and culinary purposes must be clear, colorless, odorless, pleasant to the taste, and must not endanger the lives or health of human beings. These general requirements pertain to the water as it is finally delivered to the consumer.

Chapter 7 of the California Health and Safety Code contains laws and standards relating to domestic water supply. Section 4010.5 of this code refers to the drinking water standards promulgated by the United States Public Health Service for water used on interstate carriers. These criteria have been adopted by the State of California. They are set forth in detail in United States Public Health Report, Volume 61, No. 11, March 15, 1956.

According to Section 4.2 of the above-named report, chemical substances in drinking water supplies, either natural or treated, should not exceed the concentrations shown in Table I.

TABLE I

LIMITING CONCENTRATIONS OF MINERAL CONSTITUENTS

FOR DRINKING WATER

United States Public Health Service
Drinking Water Standards, 1946

Constituent	Parts per million
<u>Mandatory</u>	
Fluoride (F)	1.5
Lead (Pb)	0.1
Selenium (Se)	0.05
Hexavalent Chromium	0.05
Arsenic (As)	0.05
<u>Non-Mandatory but Recommended Values</u>	
Iron (Fe) and Manganese (Mn) together	0.3
Magnesium (Mg)	125
Chloride (Cl)	250
Sulfate (SO ₄)	250
Copper (Cu)	3.0
Zinc (Zn)	15
Phenolic Compounds in terms of Phenol	0.001
Total Solids, desirable	500
permitted	1,000

The suspected relationship of infant methemoglobinemia occurrence to nitrates in the water supply has led to limitation of allowable nitrates in drinking water. The California State Department of Public Health has recommended a tentative limit of 10 ppm nitrate nitrogen (44 ppm nitrates) for domestic waters. Any water containing higher concentrations should be considered of questionable suitability for domestic and municipal use.

Limits may be established for other organic or mineral substances if their presence in water renders it hazardous, in the judgment of State or local health authorities.

An additional factor with which users are concerned is the hardness of the water. Hardness is due principally to carbonates and sulfates of calcium and magnesium, and is generally evidenced by inability to develop suds when using soap. In general domestic use, hardness can result in increased soap consumption, excessive repairs to plumbing, and the necessity or desirability of maintaining individual water softening appliances. The following classification for degree of hardness has been suggested by the United States Geological Survey.

<u>Class</u>	<u>Range of Hardness in ppm</u>	
1	0-55	Soft
2	56-100	Slightly hard
3	101-200	Moderately hard
4	201-500	Very hard

Criteria for Irrigation Water

Because of the diverse climatological conditions, crops, soils, and irrigation practices in California, criteria which may be set up to establish the suitability of water for irrigation use must necessarily be of a general nature, and judgment must be used in their application to individual cases. Dr. L. D. Doneen, Professor of Irrigation at the University of California at Davis, a recognized authority on irrigation water quality, has suggested limiting values for total dissolved solids, chloride concentration, per cent sodium and boron concentration for three general classes of irrigation water as shown in Table 2.

TABLE 2
QUALITATIVE CLASSIFICATION OF
IRRIGATION WATERS

	Class I	Class II	Class III
Chemical Properties	: :Excellent to good: :"Suitable under : most conditions" : :	: : Good to injurious :"Suitability depend- :ent on soil, crops, :climate and other :factors" :	: :Injurious to :Unsatisfactory :"Unsuitable : under most : conditions" :
Total dissolved solids			
In ppm	Less than 700	700-2,000	More than 2,000
In conductance EC x 10 ⁶	Less than 1,000	1,000-3,000	More than 3,000
Chloride ion concentration			
In milliequivalents per liter	Less than 5	5-10	More than 10
In ppm	Less than 175	175-350	More than 350
Sodium in per cent of base constituents	Less than 60	60-75	More than 75
Boron in ppm	Less than 0.5	0.5-2.0	More than 2.0

Criteria for Industrial Uses

The water quality criteria for the diversified uses of water in industry range from the exacting requirements for make-up water for high pressure boilers to the minimum requirements for water for washdown and metallurgical processing.

Industrial uses of water also include water utilized for food processing purposes. It may be stated that with the exception of certain canning operations such waters should at least conform to the quality requirements previously cited for drinking water supplies. Some food processing industries are even more exacting in their water quality requirements than those set forth in the United States Public Health Service "Drinking Water Standards".

Because of the large number of industrial uses of water and widely varied quality requirements, it is practicable to establish only very broad criteria of quality. These variable conditions make it desirable to consider water quality requirements in broad and general terms only, and where possible, for groups of related industries rather than individually. The general quality requirements of several individual and major groups of water uses are listed in Table 3. The values shown in this table are those suggested in the Progress Report of the Committee on Quality Tolerance of Water for Industrial Uses in the Journal of the New England Water Works Association, Volume 54, 1940.

TABLE 2

WATER QUALITY TOLERANCE FOR INDUSTRIAL USES^a

Allowable limits in parts per million

Use	Turbidity	Color	Hardness as CaCO ₃	Iron as Fe	Manganese as Mn	Total solids	Alkalinity as CaCO ₃	Odor taste	Hydrogen sulfide	Miscellaneous Requirements

a-Moore, E. W., Progress Report of the Committee on Quality Tolerances of Water for Industrial Uses; Journal New England Water Works Association, Volume 54, Page 271, 1940.

b-Potable water, conforming to U.S.P.H.S. standards, is necessary.

c-Limit given applies to both iron alone and the sum of iron and manganese.

CHAPTER II - SURFACE WATER QUALITY

In 1955 and 1956 the streams emanating from the Coast Ranges north of San Francisco and from the Sierra Nevadas contained waters of excellent quality, with total dissolved solids generally below 150 parts per million (ppm).

Streams draining the coastal areas extending southerly from San Francisco to the Mexican boundary, and those draining into the Colorado and Lahontan basins contained waters varying from good to poor quality with total dissolved solids ranging up to 1,000 ppm.

These streams as they pass from their mountain watersheds through the valley floor or coastal plain, receive irrigation return flow, ground water drainage, and waste water discharges, resulting in progressively greater concentration of salts with increasing distance from the mountains. In fact, during summer and early fall, flow in portions of many streams is comprised almost entirely of water from these sources.

Radiological assays of surface waters conducted as part of this program indicate no significant amounts of radioactivity other than normal background counts during this reporting period.

North Coastal Region (No. 1)

Stream sampling stations in the North Coastal Region are presently located on the following streams: (1) Klamath River, (2) Smith River, (3) Trinity River, (4) Eel River, (5) South Fork Eel River, (6) Russian River, and (7) East Fork Russian River.

Surface waters in this region are generally of bicarbonate type with calcium and magnesium constituting the major cations. Mineral analyses of samples display but comparatively little variation in mineral constituents

with remarkably low concentrations of total dissolved solids, low per cent sodium, and are generally very soft. Under conditions of abundant rainfall, and sustained stream flow throughout the year, there is little opportunity for the wide variation in mineral concentration and composition which characterize the waters of most arid regions.

A study of water analyses reveals that, except for occurrence of relatively high concentrations of boron in the Russian River during summer months, the waters in the streams sampled are of excellent quality and well suited for most beneficial uses except that for domestic and municipal uses, some treatment and purification would be necessary.

The waters of the Eel River, especially samples obtained at the stations near McCann and Scotia during the summer months, show total hardness in the slightly to moderately hard classification.

As reported in Water Quality Investigations Report No. 15, "Quality of Surface Waters in California, 1951-1954", boron was detected in the Russian River at Healdsburg and was found to originate in waste from a dry-ice manufacturing plant located between Hopland and Healdsburg. Upon further investigation by the North Coastal Regional Water Pollution Control Board and this Department, the source of this pollution was found to be a deep well supplying the dry-ice plant. During the period of investigation, the plant was discharging approximately 500 to 750 gallons per minute of waste water from this carbon dioxide well to the Russian River. Samples of this water contained from 404 to 690 ppm of boron as well as extremely high concentrations of other mineral constituents. For the period January, 1955 to January, 1956, boron content of the Russian River at Healdsburg, below the waste discharge, ranged from 0.11 to 4.3 ppm. Operation of the plant was halted in July, 1956. The quality of water in the Russian River at Healdsburg will be observed to determine whether this plant shut-down will alleviate the boron problem.

No other significant trends in mineral composition or concentration of surface waters in the North Coastal Region are evidenced in analyses obtained during the course of this program. Seasonal variations in water quality are shown graphically on Plates 2 through 5 for selected streams within the region. Sampling station data for this region are shown in Table 1 of Appendix A, and analyses in Tables 10 and 19 of this appendix.

San Francisco Bay Region (No. 2)

Surface water samples are presently collected from the following San Francisco Bay Region streams: (1) Napa River, (2) Alameda Creek, (3) Los Gatos Creek, (4) Coyote Creek.

Surface runoff of the San Francisco Bay Region is generally of good to excellent mineral quality and suitable for domestic, agricultural, and industrial uses with exception of the tidewater reaches. The waters of the region are principally of the bicarbonate type, and the dominant base is either calcium, magnesium or sodium, dependent upon mineral composition of the rock formations in the drainage basin.

Analyses of samples show the waters to be slightly to moderately hard. Although waters of the region are suitable for most uses; samples collected from Alameda Creek near Niles contained concentrations of total dissolved solids near the upper limit for Class I irrigation water while boron concentration has been noted as high as 1.8 ppm. A few of the smaller streams including those tributary to Napa River and Coyote Creek, occasionally have boron content near the upper safe limit for boron sensitive plants.

Mineral concentration of waters at Alameda Creek near Niles shows a gradual increase through the summer months of 1955, and a subsequent decrease from that time through the summer of 1956. During December, 1955, and January, 1956, these waters showed a marked decrease in total dissolved solids, chlorides, and total hardness. Insufficient data are available to predict with any degree of certainty whether this is a cyclic phenomenon or whether it is due to the flushing action of flood runoff waters. Seasonal variations in water quality are shown graphically on Plate 6 for Alameda Creek near Niles.

Sampling station and analyses data are presented in Tables 2, 11 and 20 of Appendix A.

Central Coastal Region (No. 3)

Samples are collected from the following Central Coastal Region streams: (1) Salinas River, (2) Santa Ynez River, (3) San Lorenzo River, (4) Soquel Creek, (5) Pajaro River, (6) Carmel River, (7) Uvas Creek.

Surface waters in the coastal drainage from the Santa Lucia and Gabilan Ranges and from Santa Ynez, San Rafael, and Santa Cruz Mountains are generally of good quality, with low total dissolved solids, per cent sodium, and boron. Total hardness of these waters is low and generally suitable for most household uses. The coastal streams are uniformly calcium-magnesium bicarbonate type waters. Many streams draining interior basins are high in sulfate and have relatively high total dissolved solids. They usually contain significant amounts of boron, probably originating from juvenile waters rising along faults.

During periods of flood runoff, the waters in most streams of this region are of good mineral quality and suitable for all but the most exacting uses. However, the periods of low flow water in many of the major streams

consist largely of return irrigation waters and mineralized ground water drainage. During these low flow periods mineral concentrations approach maximum limits of usability.

Surface inflow to the Salinas River Basin from Santa Lucia Range, and from the part of its drainage area above the mouth of Nacimiento River, is generally low in total dissolved solids, boron, and per cent sodium, and is a bicarbonate type water.

Water from the Santa Maria River near Santa Maria shows higher calcium sulfate than inflow from Sisquoc River, and the latter is lower in total dissolved solids than flow of either Cuyama or Santa Maria Rivers. Except during brief periods of flood flow the mineral content of the Cuyama and Santa Maria Rivers approaches the upper limit of Class I irrigation water.

In addition to seasonal fluctuations in mineral concentrations, some general trend toward greater mineral concentration in certain streams of the Central Coastal Region have been evidenced in analyses performed under this program. In contrast to this, samples collected from Pajaro River near Chittenden show a gradual build up of total dissolved solids and increase in chloride concentration through the summer of 1954, a slight decrease in the summer of 1955, and a sharp decline between December, 1955, and January, 1956. Here as elsewhere this latter decline as well as the notably lower mineral concentrations during the subsequent summer may be attributed to the unusually high flood flows during December, 1955, and January, 1956. The aforementioned increase and subsequent decrease in mineral concentration in samples from Pajaro River near Chittenden is illustrated on Plate 7. As may be seen there is a marked decrease in concentration of mineral solubles with increased flow during the winter runoff months.

Sampling station and analyses data are presented in Tables 3, 12 and 21 of Appendix A.

Los Angeles Region (No. 4)

Stream sampling stations in the Los Angeles Region are presently located on the following streams: (1) Matilija Creek, (2) Ventura River, (3) Santa Clara River, (4) Los Angeles River, (5) Rio Hondo, (6) Mission Creek, (7) San Gabriel River, (8) Metropolitan Water District Aqueduct at La Verne, and (9) Mono-Owens Aqueduct at San Fernando Reservoir.

Surface waters in this region vary widely in character according to location. Quality is generally better in most streams during periods of high flow than during periods of low flow. Since annual runoff during the reporting period was considerably less than the long time mean values for most of the natural streams in the Los Angeles Region, the general water quality was below normal.

The Los Angeles River in its lower reaches serves as a drainage channel through the Los Angeles Metropolitan Area. The flows monitored, particularly at Station No. 48, (Los Angeles River at Long Beach) include varying quantities of wastes which have a pronounced effect upon water quality. An illustration of the wide range in mineral concentration of water sampled at this station during the reporting period may be seen in Table 13 where chloride concentration varied between 172 parts per million in February, 1955, and 8275 parts per million in May, 1956.

The San Gabriel River at Azusa contains varying amounts of Colorado River water released from Morris Reservoir. Colorado River water has also periodically been released from Puddingstone Reservoir for spreading in the Los Angeles Forebay and has been sampled at the Whittier Narrows Station on the San Gabriel River. Therefore analyses at this station are not indicative of the native water. It is contemplated that the San Gabriel River station at Azusa will be moved upstream above the reach affected by imported water.

Waters of Matilija Creek show a fluctuation of boron from 0.6 to 4.3 ppm. Additional samples are presently being collected within the Ventura River System in cooperation with Ventura County to determine the magnitude and extent of the boron problem.

Santa Clara River water is poor quality, has a high sulfate content, and is extremely hard. This river system also includes waters containing significant quantities of boron. The water in Santa Clara River at the Santa Paula Station is of better quality than the water at the Los Angeles-Ventura County line station. This improvement in quality is attributed to the effect of better quality tributary inflow from Sespe and Piru Creeks. Inclusion in the monitoring program of sampling stations on these two tributaries is being considered. Seasonal variations in water quality are shown graphically on Plate 8 for the Santa Clara River at Los Angeles-Ventura County Line.

Sampling station data for this region are shown in Table 4, and analyses for these stations in Table 13 and 22 of Appendix A.

The tremendous urban and industrial development taking place within this region and the associated increase in waste disposal problems necessitate the addition of other stations to provide essential data for control of pollution and contamination of the surface and ground waters.

Central Valley Region (No. 5)

Because of the great size of the Central Valley Region and the wide variance in mineral characteristics and concentration of the surface water supplies, more sampling stations are located in this region than in any other. The streams, lakes, and other water supplies sampled under this program in the Central Valley Region are listed hereunder as follows:

Sacramento River
Cottonwood Creek
Stony Creek
Sacramento Slough
Calaveras River
Pit River
Burney Creek
Indian Creek
McCloud River
Feather River
Yuba River
American River
Mokelumme River
San Joaquin River
Stanislaus River
Tuolumne River
Merced River
Kings River
Kaweah River
Kern River
Clear Lake
Cache Creek

Bear River
North Fork Cache Creek
Putah Creek
Butte Creek
Big Chico Creek
Colusa Trough
Mill Creek
South Honcut Creek
Tule River
Delta-Mendota Canal
Consumnes River
Deer Creek
Delta-Cross Channel
Little Potato Slough
Stockton Ship Channel
Old River
Italian Slough
Indian Slough
Rock Slough
Lindsey Slough
Bear Creek

The concentration of mineral solubles in surface streams varies widely with stream regimen. There is a gradual increase in mineral content during the course of flow from the foothills across the valley floor. It may be generalized that concentration of salts is usually lower in the northern and northeastern portions of the Central Valley Region than in the southern and southwestern portion, owing to dilution from more abundant rainfall and runoff, and because soluble salts have been leached from the alluvium in past geological time.

From point of view of mineral characteristics, surface water of the Central Valley Region may be divided geographically into "east side", "west side", and "axial".

Waters in streams that flow from the Sierra Nevada are generally of excellent mineral quality at the eastern edge of the valley floor, and suitable from that standpoint for most purposes without treatment. Water in streams from the Cascade and Klamath Mountains, tributary to the

Sacramento Basin in the north, is of similar high quality. All of the aforementioned waters are in the "east side" quality classification and are uniformly calcium bicarbonate in type. Total mineral solids in these waters is generally less than 100 parts per million.

Included in the "west side" quality classification are those waters of all streams draining the coastal ranges north to Stony Creek, and from the San Emigdio and Tehachapi Mountains at the southern end of San Joaquin Valley. The largest of these streams are Cache and Putah Creeks. Average concentration of salts in these two streams is three to four times that which occurs in the "east side" streams. Much higher concentrations of mineral solubles, ranging from about 250 to 3800 ppm are contained in the water of "west side" streams flowing into San Joaquin River. The most important of these are San Luis, Los Banos, Little Panoche, Cantua, and Los Gatos Creeks. The combined flows of these streams are small, but they contain relatively high amounts of dissolved mineral matter, including up to 17 ppm of boron. These waters are either chloride or sulfate in type, in contrast with the uniformly bicarbonate "east side" waters.

A mixture of "east side" and "west side" waters plus return irrigation and effluent ground water seepage comprise the surface waters of the valley trough. This classification is herein termed "axial" waters. Surface inflow from east side tributaries is generally so large that the effect of the poorer quality "west side" waters is obscured in the mixture. However, the effect of ground water effluent seepage, primarily irrigation return, is noticeable much of the time in San Joaquin River between Mendota Pool and the Sacramento-San Joaquin Delta. During periods of relatively low flow, chloride and sulfate content is generally greater than bicarbonate content in the reach of the San Joaquin River between Mendota Pool and the confluence of Sacramento River.

The Sacramento River, the largest watercourse in the state, falls in the "axial" group. At the Sacramento sampling station, the waters show a remarkably uniform quality pattern from year to year. Total dissolved solids generally range below 175 parts per million in waters sampled at this station and hardness is generally below 90 ppm. Concentration of mineral solubles were greatly reduced during the summer of 1956, perhaps as a result of extremely high flows during December, 1955, and January, 1956.

Streams in areas of the San Joaquin Valley, where water supplies are more fully developed, show a continuing trend toward greater mineralization. Although the increase, in many cases, is slight, the trend is apparent and probably will continue until imported waters are available to provide sufficient dilution to carry off the increasing amounts of return irrigation flows and municipal and industrial wastes or a waste conveyance system is provided.

Sampling station and analyses for this region are listed in Tables 5, 14, and 23 of Appendix A. Fluctuations in quality characteristics for the major streams are shown graphically on Plates 10 through 15.

Lahontan Region (No. 6)

Samples are collected and analyses reported herein for Lake Tahoe and the following streams: (1) Susan River, (2) Truckee River, and (3) Mojave River.

The surface waters draining the eastern slopes of the Warner Range and the Sierra Nevadas are of excellent mineral quality and well suited for general use, as are the waters draining the north slopes of the San Gabriel and San Bernardino Mountains. These mountains, composed largely of granitic materials, contribute only slight quantities of mineral solubles. Surface water from the Owens River watershed are calcium bicarbonate in type as are the waters of the Mojave River. These waters have similar characteristics

except that those of Mohave River have a somewhat greater total hardness and lower boron content. The higher boron content of Owens River is due largely to mineralized hot spring waters flowing in from Hot Creek. These spring waters contain 10 or more parts per million of boron.

The waters of the monitored streams in the Lahontan Region are of excellent mineral quality and from a standpoint of irrigation are all class I waters; although waters sampled from Mojave River near Victorville are slightly hard. No significant trend toward greater mineral concentration is noticeable.

Sampling station and analyses data for this region are presented in Tables 6, 15 and 24 of Appendix A. A graphical representation of water quality characteristics of the Truckee River near Farad is shown on Plate 16.

Colorado River Basin Region (No. 7)

Sampling stations in the Colorado River Basin Region are presently located on the following water courses: (1) Colorado River, (2) All American Canal, (3) New River, (4) Alamo River, and (5) Whitewater River.

Throughout this region, rainfall is sparse, and the occasional heavy rains often result in flash floods. These floods generally have high instantaneous discharges but are of short duration. The runoff is usually of good quality. Except for the Colorado River, natural surface streams in the region are usually dry throughout most of the year.

Water flowing in the All American Canal is diverted from the Colorado River. It is sodium-calcium sulfate in character and is Class II irrigation water. The New and Alamo Rivers, which enter the United States from Mexico, are made up, in large part, of irrigation return flows and

canal spills from the All American Canal and distribution canals of the Imperial Irrigation District. Water in these two rivers is usually sodium chloride in character and Class III irrigation water. At the International Boundary, the New River poses a serious quality problem because of the industrial wastes and raw sewage discharges from the City of Mexicali. At New River near Calexico, (station No. 57), bacterial counts have reached 30 million MPN (most probable number per milliliter).

The Whitewater River is calcium bicarbonate in character and meets the mineral quality criteria for Class I irrigation water. Water is diverted from the Whitewater River one and one-half miles upstream from Whitewater and piped to Palm Springs for non-domestic use.

Because of the stability of the character and mineral content of these waters, consideration is being given to placing these stations on a bi-monthly sampling schedule. Sampling station and analyses data for this region are given in Tables 7, 16 and 25 of Appendix A.

Santa Ana Region (No. 8)

Sampling stations in the Santa Ana Region are presently located at Lake Elsinore and on the following streams: (1) Santa Ana River, (2) Warm Creek, and (3) Chino Creek.

In this region, mineral quality of surface runoff varies with flow, being noticeably better during periods of high flow. Accordingly, it should be observed that runoff during the reporting period was less than 50 per cent of the long time mean runoff.

At several of the stream sampling stations within this region, analyses showed great variation in characteristics. This variation particularly notable in analyses from the Prado and Arlington stations on

the Santa Ana River, is due to the mixing of imported Colorado River water with the natural flow of the Santa Ana River. In the natural waters, bicarbonate is the predominant anion, but in the mixed waters sulfate is the predominant anion. Both the natural and mixed waters are of good quality for irrigation use and fall within the standards for Class I or Class II. Despite the hardness of these waters, they are suitable for domestic use. Water in the Santa Ana River near Mentone is soft and of excellent mineral quality. It is calcium bicarbonate in character and has its origin in precipitation on the San Bernardino Mountain areas, where man's activity has not as yet resulted in noticeable impairment of water quality.

Warm Creek channel carries natural surface runoff, rising ground water, and treated effluent from the San Bernardino sewage treatment plant. The creek is tributary to Santa Ana River but virtually all of the low flows are diverted into the Riverside Canal for irrigation use. The Warm Creek station at Colton, No. 50b, serves to monitor the effect of sewage discharge into Warm Creek. The second Warm Creek station, No. 50c, at San Bernardino monitors the natural flow of the creek. During periods of low flow, most of the flow at this station is diverted for irrigation purposes into the Meeks and Daley Canal. Natural Warm Creek water is calcium bicarbonate in character, hard, and Class I for irrigation. The San Bernardino sewage effluent is sodium bicarbonate in character, hard, and Class I for irrigation.

Chino Creek is tributary to the Santa Ana River just above Prado Dam. The flow in this creek consists mainly of Chino sewage plant effluent, except when there is sufficient rain to cause runoff. This effluent is normally calcium bicarbonate in character, hard, and of good mineral quality.

Lake Elsinore has been dry most of the time since 1952. There was sufficient water to sample at only one time during the period of this report. This was in February, 1956, when the total dissolved solids content was 10,500 ppm. The lake water, when it can be sampled, is usually sodium chloride in character and moderately hard.

Continued urban and industrial growth in this region requires full development, conservation, and protection of local water supplies. Therefore, continued monitoring of these surface waters at existing stations is important, and consideration is being given to the establishment of additional stations on the San Jacinto River.

Sampling station data and analyses for this region are shown in Tables 8, 17 and 26, of the Appendix A. A quality characteristics graph for the Santa Ana River near Mentone is presented on Plate 17.

San Diego Region (No. 9)

Sampling stations in the San Diego Region are presently located on the following streams: (1) Santa Margarita River, (2) San Luis Rey River, (3) Escondido Creek, (4) San Dieguito River, (5) San Diego River, and (6) Tia Juana River.

Drought conditions which have prevailed throughout southern California for the past decade have been severe in the San Diego area. The effect of sub-normal precipitation and runoff in San Diego County is manifest in the surface water storage which averaged approximately 15 per cent of the total reservoir capacity during 1955 and 1956, in spite of the importation of 269,648 acre-feet of Colorado River water during the period. These severe drought conditions are reflected in the monitoring program by lack of sufficient flow to sample and by high mineral concentration in low flows sampled.

Throughout most of this region, the surface waters are sodium chloride in character; however, the waters of San Luis Rey River near Pala and San Dieguito River near San Pasqual Valley are calcium to sodium bicarbonate in character.

The Santa Margarita River near Fallbrook displays relatively little variation in mineral quality and is normally Class II irrigation water, occasionally becoming Class I during high flows. This water is sodium bicarbonate-chloride in character and is very hard. Santa Margarita River flows the entire year at this station, but the discharge is very small during the summer months.

The Pala Station on San Luis Rey River is located about 25 miles inland from the coast. Water in the river at this station is of good quality but hard.

The dry weather flow of Escondido Creek consists mainly of effluent from the Escondido sewage plant. The Creek at the sampling point is normally dry during the summer months, since the sewage effluent is used to irrigate permanent pasture upstream. This water is variable in quality, reflecting the effect of both sewage treatment plant effluent and waste discharges from a stone quarry. Quarry cooling water with cutting waste enters Escondido Creek just above the station during periods when the quarry is in operation. At a point 200 yards downstream from the station a small earth dam is usually built after spring rains. This dam backs up water beyond the station and influences the water quality. The water sampled from Escondido Creek near Harmony Grove (Station No. 63) is hard and is generally class III irrigation water.

The sampling station on the San Dieguito River is located below San Pasqual Valley and just upstream from the San Diego Aqueduct crossing.

Because of its location and the drought conditions extant during the reporting period, there has been no flow at this station most of the time. Past analyses show this water to be Class I for irrigation and hard.

The San Diego River, sampled just below Old Mission Dam, normally flows after a heavy rain. The remainder of the time, water is ponded above and below the dam, and samples are taken from the downstream pond. Analyses show this water to be sodium chloride in character, very hard and Class I to Class III irrigation water, depending on flow.

Runoff in the Tia Juana River is controlled in Rodriguez Reservoir in Mexico. During the reporting period, the only surface flow at the station near the international boundary was tributary runoff from the area below Rodriguez Dam. Development of ground water from the upper Tia Juana Valley in Mexico by the City of Tia Juana has caused further depletion of the surface flow in the river. Runoff at Station No. 66 (Tia Juana River at International Boundary) is sodium chloride in character, very hard and ranges from Class I to Class III for irrigation depending upon flow. Flows often contain trash and domestic wastes from sections of the City of Tia Juana constructed along and in the river channel.

Rapid urban and industrial development of San Diego County has taxed the available water supply to the limit and plans are under preparation to provide for importation of additional water. Protection of the quality of local water supplies is therefore important, and emphasizes the need for continuation of the monitoring program in this region. However, since mineral quality has been consistent and flows generally small, consideration is being given to placing the program on a bi-monthly basis in this region.

Sampling station data and analyses for this region are shown in Tables 9, 18 and 27, Appendix A. The mineral characteristics of Santa Margarita River near Fallbrook are presented on Plate 18.

PERIODIC STREAM SAMPLING STATIONS

1955-1956

Because of its location and the drought conditions extant during the reporting period, there has been no flow at this station most of the time. Past analyses show this water to be Class I for irrigation and hard.

The San Diego River, sampled just below Old Mission Dam, normally flows after a heavy rain. The remainder of the time, water is ponded above and below the dam, and samples are taken from the downstream pond. Analyses show this water to be sodium chloride in character, very hard and Class I to Class III irrigation water, depending on flow.

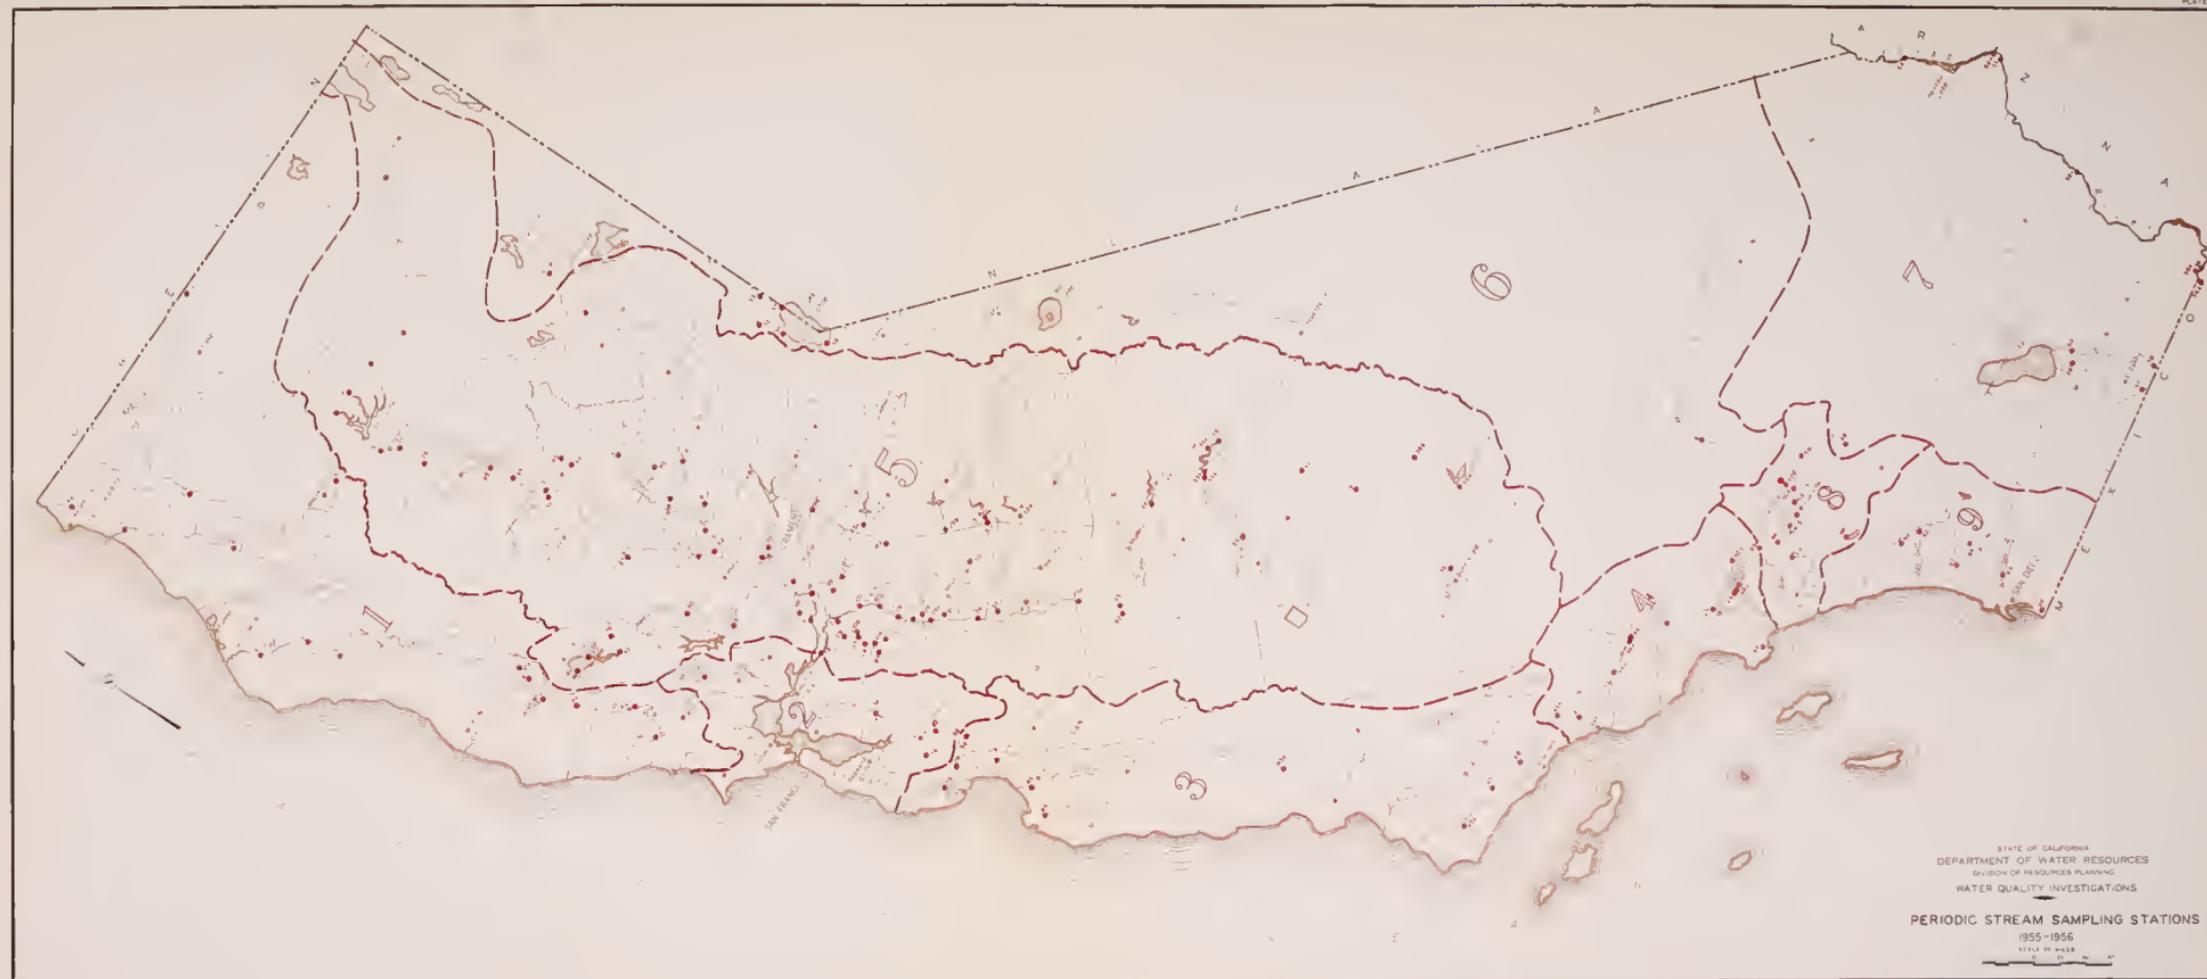

Runoff in the Tia Juana River is controlled in Rodriguez Reservoir in Mexico. During the reporting period, the only surface flow at the station near the international boundary was tributary runoff from the area below Rodriguez Dam. Development of ground water from the upper Tia Juana Valley in Mexico by the City of Tia Juana has caused further depletion of the surface flow in the river. Runoff at Station No. 66 (Tia Juana River at International Boundary) is sodium chloride in character, very hard and ranges from Class I to Class III for irrigation depending upon flow. Flows often contain trash and domestic wastes from sections of the City of Tia Juana constructed along and in the river channel.

Rapid urban and industrial development of San Diego County has taxed the available water supply to the limit and plans are under preparation to provide for importation of additional water. Protection of the quality of local water supplies is therefore important, and emphasizes the need for continuation of the monitoring program in this region. However, since mineral quality has been consistent and flows generally small, consideration is being given to placing the program on a bi-monthly basis in this region.

Sampling station data and analyses for this region are shown in Tables 9, 18 and 27, Appendix A. The mineral characteristics of Santa Margarita River near Fallbrook are presented on Plate 18.

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Eel River near McCann

SAMPLING POINT Summer bridge near left bank.

STATION NO. 5 REGION NO. 1 COUNTY Humboldt

AT RIVER MILE 46.5 SEC. 3, T 2 S, R 3 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-89 TABLE 1

STATION Eel River at Scotia

SAMPLING POINT Left bank below U. S. Highway 101 bridge between
Scotia and Rio Dell.

STATION NO. 6 REGION NO. 1 COUNTY Humboldt

AT RIVER MILE 21.8 SEC. 7, T 1 N, R 1 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-91 TABLE 1

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Eel River, South Fork, near Miranda

SAMPLING POINT Right bank below gage six miles south of Miranda at
Sylvandale camp grounds on U. S. Highway 101 and 0.9 mile
south of Rocky Glen Creek.

STATION NO. 7 REGION NO. 1 COUNTY Humboldt

AT RIVER MILE 20 SEC. 30, T 3 S, R 4 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-93 TABLE 1

STATION Klamath River near Copco

SAMPLING POINT Right bank at USGS gaging station one mile south of
Copco post office, one-half mile downstream from Copco No. 2
plant of the California-Oregon Power Company and 500 feet
downstream from Fall Creek.

STATION NO. 1 REGION NO. 1 COUNTY Siskiyou

AT RIVER MILE 190 SEC. 36, T 48 N, R 5 W, MDB&M

SAMPLED BY Department of Fish and Game

ANALYSIS ON PAGE A-95 TABLE 1

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Klamath River near Klamath

SAMPLING POINT Right bank at USGS gage located 5.7 miles upstream
from town of Klamath.

STATION NO. 3 REGION NO. 1 COUNTY Del Norte

AT RIVER MILE _____ SEC. 17, T 13 N, R 2 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-97 TABLE 1

STATION Klamath River at Somesbar

SAMPLING POINT Left bank 100 feet downstream from gage, 1 mile west
of Somesbar post office and 300 feet downstream from Salmon
River.

STATION NO. 2 REGION NO. 1 COUNTY Siskiyou

AT RIVER MILE 64 SEC. 4, T 11 N, R 6 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-99 TABLE 1

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Russian River, East Fork, near Calpella

SAMPLING POINT Left bank about 0.2 mile downstream from gage. Gage
located on right bank, 5.1 miles east of U. S. Highway 101 on
State Route No. 20.

STATION NO. 8 REGION NO. 1 COUNTY Mendocino

AT RIVER MILE 6.0 SEC. 13, T 16 N, R 12 W, MDB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-101 TABLE 1

STATION Russian River, East Fork, at Potter Valley Power House

SAMPLING POINT Tailrace of PG&E powerhouse, 3 miles northeast of
town of Potter Valley.

STATION NO. 10a REGION NO. 1 COUNTY Mendocino

AT RIVER MILE _____ SEC. 6, T 17 N, R 11 W, MDB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-103 TABLE 1

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Russian River at Guerneville

SAMPLING POINT Right bank below highway bridge in Guerneville,
6.5 miles upstream from Austin Creek.

STATION NO. 10 REGION NO. 1 COUNTY Sonoma

AT RIVER MILE 15 SEC. 32, T 8 N, R 10 W, MDB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-105 TABLE 1

STATION Russian River near Healdsburg

SAMPLING POINT Left bank below gage, 2 miles east of Healdsburg and
3.5 miles upstream from Dry Creek.

STATION NO. 9 REGION NO. 1 COUNTY Sonoma

AT RIVER MILE 35.6 SEC. 22, T 9 N, R 9 W, MDB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-107 TABLE 1

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Russian River near Hopland
 SAMPLING POINT Right bank below gage of abandoned bridge 0.6 mile off
U. S. Highway 101 on Largo Road and 3.8 miles north of
Hopland.

STATION NO. 8a REGION NO. 1 COUNTY Mendocino
 AT RIVER MILE 85.7 SEC. 36, T 14 N, R 12 W, MDB&M
 SAMPLED BY BSE--Berkeley
 ANALYSIS ON PAGE A-109 TABLE 1

STATION Russian River near Ukiah
 SAMPLING POINT Left bank upstream from Talmadge Road Bridge about 1
mile southeast of Ukiah.

STATION NO. 10b REGION NO. 1 COUNTY Mendocino
 AT RIVER MILE _____ SEC. 28, T 15 N, R 12 W, MDB&M
 SAMPLED BY BSE--Berkeley
 ANALYSIS ON PAGE A-111 TABLE 1

TABLE I
SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Smith River near Crescent City

SAMPLING POINT From left bank below gage, 8 miles east of Crescent City
and 0.5 mile downstream from South Fork.

STATION NO. 3a REGION NO. 1 COUNTY Del Norte

AT RIVER MILE 17 SEC. 10, T 16 N, R 1 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-113 TABLE 1

STATION Trinity River near Hoopa

SAMPLING POINT From left bank near gage located 2 miles southeast of
Hoopa and 0.5 mile downstream from Campbell Creek on Hoopa
Indian Reservation and on property of Sugar Pine Lumber
Company.

STATION NO. 4 REGION NO. 1 COUNTY Humboldt

AT RIVER MILE 15.3 SEC. 31, T 8 N, R 5 E, HB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-115 TABLE 1

TABLE I

SAMPLING STATION DATA
NORTH COASTAL REGION

STATION Trinity River at Lewiston.

SAMPLING POINT From left bank below gage at highway bridge at
Lewiston, 0.8 mile downstream from Deadwood Creek.

STATION NO. 4a REGION NO. 1 COUNTY Trinity

AT RIVER MILE 102 SEC. 19, T 33 N, R 8 W, MDB&M

SAMPLED BY BSE-Berkeley

ANALYSIS ON PAGE A-117 TABLE 1

TABLE 2

SAMPLING STATION DATA
SAN FRANCISCO BAY REGION

STATION Alameda Creek near Niles

SAMPLING POINT Right bank at concrete control near gage located 0.2
mile downstream from railroad bridge and 1.2 miles northeast
of Niles.

STATION NO. 73 REGION NO. 2 COUNTY Alameda

AT RIVER MILE 1 SEC. 15, T 4 S, R 1 W, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-119 TABLE 2

STATION Coyote Creek near Madrone

SAMPLING POINT Right bank at gage 0.2 mile downstream from county
road bridge and 2.8 miles northeast of Madrone.

STATION NO. 82 REGION NO. 2 COUNTY Santa Clara

AT RIVER MILE _____ SEC. 9, T 9 S, R 3 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-121 TABLE 2

TABLE 2

SAMPLING STATION DATA
SAN FRANCISCO BAY REGION

STATION Los Gatos Creek at Los Gatos
 SAMPLING POINT Sampled from left bank at foot of gage about 0.75 mile
upstream from Los Gatos and 0.25 mile downstream from Lexington
Dam.

STATION NO. 74 REGION NO. 2 COUNTY Santa Clara
 AT RIVER MILE 10.5 SEC. 29, T 8 S, R 1 W, MDB&M
 SAMPLED BY DWR-Sacramento
 ANALYSIS ON PAGE A-123 TABLE 2

STATION Napa River near St. Helena
 SAMPLING POINT At bridge which is located 1.3 miles northeast of Highway
128 on Zinfandel Lane and 2.5 miles east of St. Helena. Gage
located 0.2 mile upstream from bridge.

STATION NO. 72 REGION NO. 2 COUNTY Napa
 AT RIVER MILE _____ SEC. 33, T 8 N, R 5 W, MDB&M
 SAMPLED BY DWR-Sacramento
 ANALYSIS ON PAGE A-125 TABLE 2

TABLE 3

SAMPLING STATION DATA
CENTRAL COASTAL REGION

STATION Carmel River near Carmel

SAMPLING POINT right bank about 30 feet below Rancho San Carlos bridge
about 3 miles east of Carmel.

STATION NO. 83 REGION NO. 3 COUNTY Monterey

AT RIVER MILE _____ SEC. 17, T 16 S, R 1 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-127 TABLE 3

STATION Pajaro River near Chittenden

SAMPLING POINT right bank at Highway bridge on Chittenden Road at Santa
Cruz-San Benito County line, 1 mile southeast of
Chittenden and 2.5 miles downstream from San Benito River.

STATION NO. 77 REGION NO. 3 COUNTY Santa Cruz

AT RIVER MILE _____ SEC. 12, T 12 S, R 3 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-129 TABLE 3

TABLE 3

SAMPLING STATION DATA
CENTRAL COASTAL REGION

STATION San Lorenzo River at Big Trees (near Felton)
 SAMPLING POINT at Sequoia Gardens Resort on right bank 1.7 miles south
of Felton West of State Highway 9.

STATION NO. 75 REGION NO. 3 COUNTY Santa Cruz
 AT RIVER MILE 6.5 SEC. 26, T 10 S, R 2 W, MDB&M
 SAMPLED BY DWR-Sacramento
 ANALYSIS ON PAGE A-131 TABLE 3

STATION Salinas River near Spreckles
 SAMPLING POINT from right bank at USGS gaging station located four
miles south of Salinas, two miles west of Spreckles and
80' upstream from South Salinas-Monterey Highway bridge.

STATION NO. 43* REGION NO. 3 COUNTY Monterey
 AT RIVER MILE 12.5 SEC. 8, T 15 S, R 3 E, MDB&M
 SAMPLED BY BSE-Berkeley
 ANALYSIS ON PAGE A-133 TABLE 3

* No report since December, 1955.

TABLE 3

SAMPLING STATION DATA
CENTRAL COASTAL REGION

STATION Salinas River at Paso Robles
 SAMPLING POINT from left bank just upstream from USGS gage on State
Highway 41 bridge at Paso Robles, 3.5 mile upstream
from Huerhuero Creek.

STATION NO. 43a REGION NO. 3 COUNTY San Luis Obispo
 AT RIVER MILE 121.7 SEC. 33 T. 26 S, R 12 E, MDB&M
 SAMPLED BY BSE-Santa Barbara
 ANALYSIS ON PAGE A-134 TABLE 3

STATION Santa Ynez River below Gibraltar Dam
 SAMPLING POINT from left bank at USGS gage 700 feet downstream from
Gibraltar Dam and 7 miles north of Santa Barbara.

STATION NO. 44* REGION NO. 3 COUNTY Santa Barbara
 AT RIVER MILE 70.5 SEC. 10 T 5 N, R 27 W, SBB&M
 SAMPLED BY BSE-Santa Barbara
 ANALYSIS ON PAGE A-136 TABLE 3

* Discontinued in March, 1956.

TABLE 3

SAMPLING STATION DATA
CENTRAL COASTAL REGION

STATION Soquel Creek at Soquel

SAMPLING POINT from left bank at foot of gage, 0.25 mile upstream
from bridge on Old Santa Cruz Highway.

STATION NO. 76 REGION NO. 3 COUNTY Santa Cruz

AT RIVER MILE 1.4 SEC. 10 T. 11 S, R 1 W, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-142 TABLE 3

STATION Uvas Creek near Morgan Hill

SAMPLING POINT from right bank at foot of gage, 500 feet upstream
from Uvas Dam, 0.6 mile downstream from Eastman Canyon
and 4.8 miles southwest of Morgan Hill.

STATION NO. 96 REGION NO. 3 COUNTY Santa Clara

AT RIVER MILE _____ SEC. 18 T. 10 S, R 3 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-144 TABLE 3

TABLE 4
SAMPLING STATION DATA
LOS ANGELES REGION

STATION Los Angeles River at Los Angeles

SAMPLING POINT USGS and LACFCD gaging station at Figueroa Street
bridge, 0.1 mile upstream from Arroyo Seco confluence.

STATION NO. 47 REGION NO. 4 COUNTY Los Angeles

AT RIVER MILE 26 SEC. 15, T 1 S, R 13 W, SBB&M

SAMPLED BY LAPH and DWR, Los Angeles (May and September)

ANALYSIS ON PAGE A-147 TABLE 4

STATION Los Angeles River at Long Beach

SAMPLING POINT Highway 101 (State Street) Bridge, sampled from
left bank just downstream from bridge. LACFCD gage at
Wardlow Ave. 2 mile upstream.

STATION NO. 48 REGION NO. 4 COUNTY Los Angeles

AT RIVER MILE 1.8 SEC. 26, T 4 S, R 13 W, SBB&M

SAMPLED BY LBEH and DWR, Los Angeles (May and September)

ANALYSIS ON PAGE A-149 TABLE 4

TABLE 4

SAMPLING STATION DATA
LOS ANGELES REGION

STATION Matilija Creek above Matilija Dam
 SAMPLING POINT left bank at USGS Gaging Station 1.7 miles northwest
of Matilija and 2 miles upstream from Matilija Dam.

 STATION NO. 45b REGION NO. 4 COUNTY Ventura
 AT RIVER MILE 2.5 SEC. 19 T. 5 N, R. 23 W, SBB&M
 SAMPLED BY BSE-Santa Barbara
 ANALYSIS ON PAGE A-151 TABLE 4

STATION Metropolitan Water District Aqueduct at La Verne
 SAMPLING POINT Raw water inflow to Metropolitan Water District
Treatment Plant (monthly composite sample)

 STATION NO. 69 REGION NO. 4 COUNTY Los Angeles
 AT RIVER MILE _____ SEC. 6 T. 1 S, R. 9 W, SBB&M
 SAMPLED BY MWD
 ANALYSIS ON PAGE A-153 TABLE 4

TABLE 4

SAMPLING STATION DATA
LOS ANGELES REGION

STATION Mission Creek at Whittier Narrows

SAMPLING POINT 2 miles northeast of Montebello at LACFCD gaging

station 200 yards upstream from San Gabriel Boulevard

bridge. Sampled from right bank at gage.

STATION NO. 49a REGION NO. 4 COUNTY Los Angeles

AT RIVER MILE 1.7 SEC. 6, T 2 S, R 11 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-155 TABLE 4

STATION Mono-Owens Aqueduct near San Fernando

SAMPLING POINT at inlet to Upper San Fernando Reservoir

STATION NO. 70 REGION NO. 4 COUNTY Los Angeles

AT RIVER MILE Aqueduct SEC. 30, T 3 N, R 15 W, SBB&M

SAMPLED BY LADWP

ANALYSIS ON PAGE A-157 TABLE 4

TABLE 4

SAMPLING STATION DATA
LOS ANGELES REGION

STATION Rio Hondo at Whittier Narrows

SAMPLING POINT right bank, 125 yards upstream from San Gabriel
Boulevard bridge. Sampled at LACFCD gaging station.

STATION NO. 49 REGION NO. 4 COUNTY Los Angeles

AT RIVER MILE 9.5 SEC. 6, T 2 S, R 11 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-159 TABLE 4

STATION San Gabriel River at Whittier Narrows

SAMPLING POINT from right bank 200 feet beyond end of San Gabriel
Boulevard extended (Syphon Road) upstream from Whittier
Narrows Dam.

STATION NO. 50 REGION NO. 4 COUNTY Los Angeles

AT RIVER MILE 19.7 SEC. 5, T 2 S, R 11 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-161 TABLE 4

TABLE 4

SAMPLING STATION DATA
LOS ANGELES REGION

STATION San Gabriel River near Azusa
 SAMPLING POINT at USGS gaging station 3 miles northeast of Azusa, 1 mile
below Morris Dam. Sampled from right bank at gage.

STATION NO. 50a REGION NO. 4 COUNTY Los Angeles
 AT RIVER MILE 38 SEC. 13 T 1 N, R 10 W SBB&M
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-163 TABLE 4

STATION Santa Clara River at Los Angeles-Ventura County line
 SAMPLING POINT 1/2 mile west of Los Angeles-Ventura County line and 1/2
mile upstream from Ventura County gage. Sampled from
left bank at Newhall Ranch road crossing.

STATION NO. 46 REGION NO. 4 COUNTY Ventura
 AT RIVER MILE 40 SEC. 19 T 4 N, R 17 W SBB&M
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-165 TABLE 4

TABLE 4
SAMPLING STATION DATA
LOS ANGELES REGION

STATION Santa Clara River near Santa Paula
SAMPLING POINT station located 1.5 miles upstream from Santa Paula
bridge (Willard Bridge) and 100 feet north of South
Mountain Road. Sampled from left bank.

STATION NO. 46a REGION NO. 4 COUNTY Ventura
AT RIVER MILE 17 SEC. 12 T 3 N, R 21 W, SBB&M
SAMPLED BY DWR-Los Angeles
ANALYSIS ON PAGE A-167 TABLE 4

STATION Santa Clara River at Blue Cut
SAMPLING POINT 1 mile downstream from station 46 at Tapo Canyon pipe and
road crossing and 1/2 mile downstream from Ventura County
gaging station. Sampled downstream from road culvert.

STATION NO. 46b REGION NO. 4 COUNTY Ventura
AT RIVER MILE 39 SEC. 25 T 4 N, R 18 W, SBB&M
SAMPLED BY DWR-Los Angeles; Sampled May and September
ANALYSIS ON PAGE A-169 TABLE 4

TABLE 4
SAMPLING STATION DATA
LOS ANGELES REGION

STATION Ventura River near Ventura

SAMPLING POINT Station located at USGS gage in Foster Memorial Park
on right bank, 5 miles north of Ventura, 300 feet
downstream from highway 150 bridge.

STATION NO. 61 REGION NO. 4 COUNTY Ventura

AT RIVER MILE 6.0 SEC. 8, T 3 N, R 23 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-171 TABLE 4

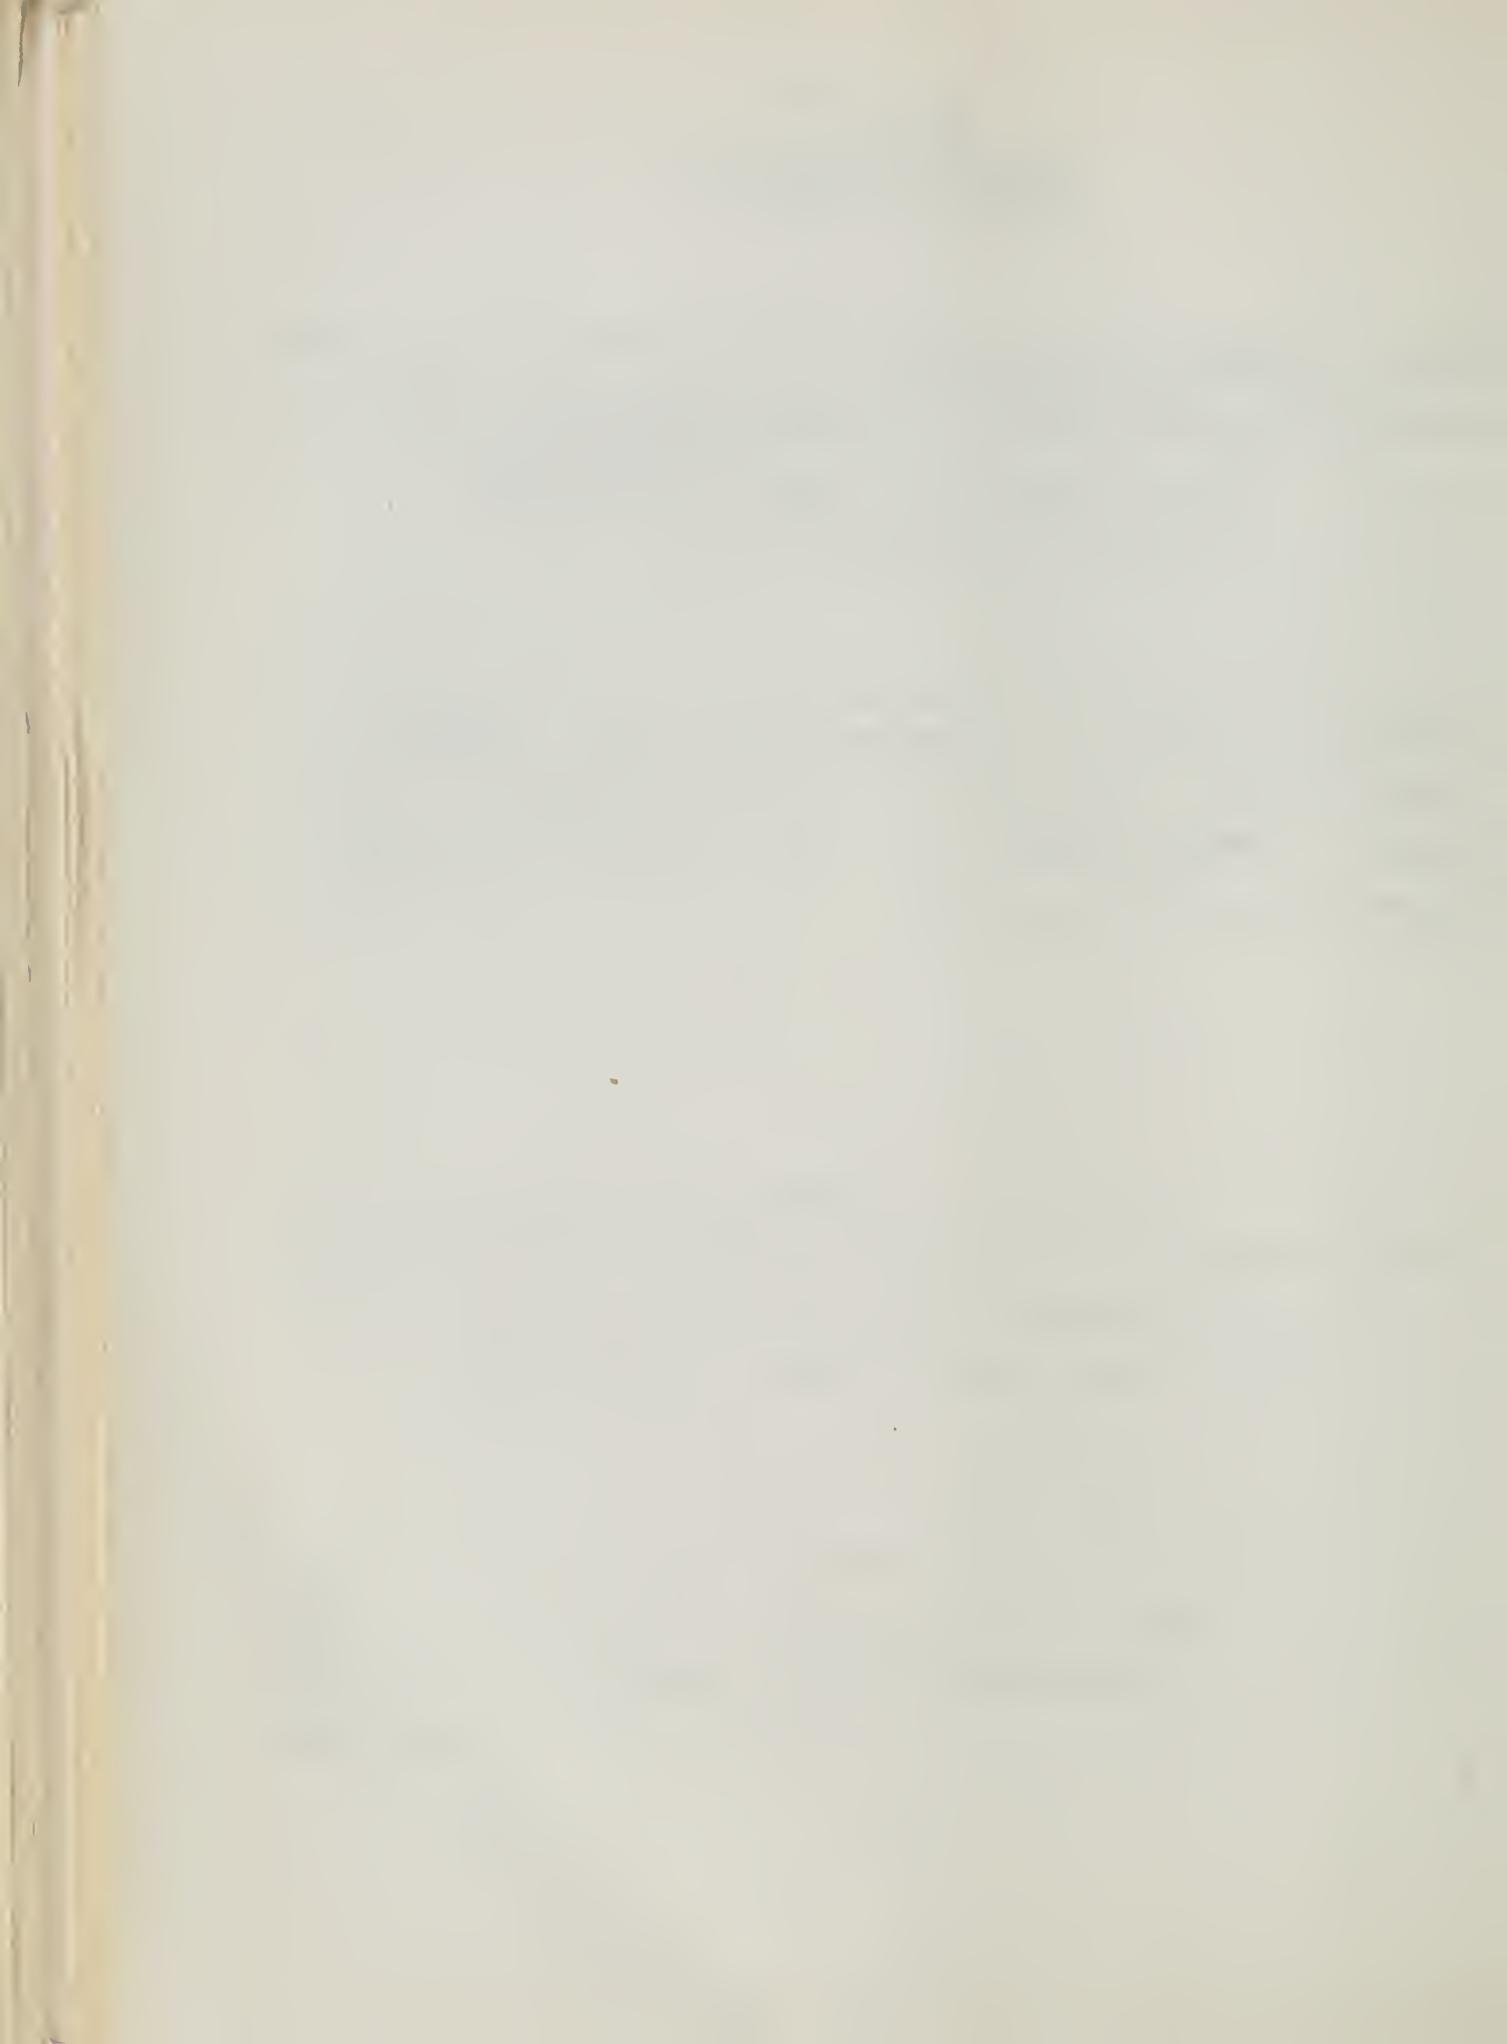

TABLE 5
SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION American River at Sacramento

SAMPLING POINT at "H" Street bridge, water stage recorder located on
left bank on upstream side of bridge.

STATION NO. 22 REGION NO. 5 COUNTY Sacramento

AT RIVER MILE 6.5 SEC. 3, T 8 N, R 5 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-173 TABLE 5

STATION Bear Creek near Stevinson

SAMPLING POINT Right bank 4.5 miles southeast of Stevinson at washed
out wooden bridge.

STATION NO. 111 REGION NO. 5 COUNTY Merced

AT RIVER MILE 0.15 SEC. 36, T 7 S, R 10 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-175 TABLE 5

TABLE 5

SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Bear River near Wheatland
 SAMPLING POINT left bank, 30 feet downstream from gage located on
downstream side of bridge on U. S. Highway 99E 1 mile southeast
of Wheatland.

STATION NO. 78 REGION NO. 5 COUNTY Placer
 AT RIVER MILE 10 SEC. 3, T 13 N, R 5 E, MDB&M
 SAMPLED BY DWR-Sacramento
 ANALYSIS ON PAGE A-177 TABLE 5

STATION Big Chico Creek near Chico
 SAMPLING POINT right bank at staff gage located one mile upstream from
golf course clubhouse in Bidwell Park and 6 miles northeast
of Chico.

STATION NO. 85 REGION NO. 5 COUNTY Butte
 AT RIVER MILE 12.9 SEC. 9, T 22 N, R 2 E, MDB&M
 SAMPLED BY DWR-Sacramento
 ANALYSIS ON PAGE A-179 TABLE 5

TABLE 5

SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Burney Creek near Burney

SAMPLING POINT Timber bridge on Jack Rabbit Flat Road. 1.5 miles
west of Burney on Highway 299.

STATION NO. 17c REGION NO. 5 COUNTY Shasta

AT RIVER MILE 13 SEC. 18 T 35 N, R 3 E MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-181 TABLE 5

STATION Butte Creek near Chico

SAMPLING POINT right bank at foot of gage 0.8 mile downstream from
Little Butte Creek and 7.5 miles east of Chico.

STATION NO. 84 REGION NO. 5 COUNTY Butte

AT RIVER MILE _____ SEC. 36 T 22 N, R 2 E MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-183 TABLE 5

TABLE 5
SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Cache Creek near Capay
SAMPLING POINT Right bank at gage located 3 miles northwest of Capay
and 2 miles upstream from Clear Lake Water Company's
diversion dam.

STATION NO. 80 REGION NO. 5 COUNTY Yolo
AT RIVER MILE _____ SEC. 8, T 10 N, R 2 W, MDB&M
SAMPLED BY DWR-Sacramento
ANALYSIS ON PAGE A-185 TABLE 5

STATION Cache Creek near Lower Lake
SAMPLING POINT Left bank at foot of gage about 500 feet downstream
from dam and about 3.5 miles southeast of State Highway 53.

STATION NO. 42 REGION NO. 5 COUNTY Lake
AT RIVER MILE _____ SEC. 6, T 12 N, R 6 W, MDB&M
SAMPLED BY DWR-Sacramento
ANALYSIS ON PAGE A-187 TABLE 5

TABLE 5

SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Cache Creek, North Fork, near Lower Lake

SAMPLING POINT bridge on State Highway 20 between Williams and Clear
Lake. Gage located on right bank 2.7 miles northwest of
bridge.

STATION NO. 79 REGION NO. 5 COUNTY Lake

AT RIVER MILE 3.0 SEC. 31 T 14 N, R 6 W, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-189 TABLE 5

STATION Calaveras River near Jenny Lind

SAMPLING POINT from right bank about 150 feet downstream from USGS
gage. Gage located 70 feet below bridge on Milton Road, 0.2
mile south of Jenny Lind.

STATION NO. 16a REGION NO. 5 COUNTY Calaveras

AT RIVER MILE 36.7 SEC. 27 T 3 N, R 10 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-191 TABLE 5

TABLE 5
SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Clear Lake near Clearlake Oaks
SAMPLING POINT at Gordy's Fish Harbor Motel at Glen Haven, 3.6 miles
northwest of Clearlake Oaks.

STATION NO. 40 REGION NO. 5 COUNTY Lake
AT RIVER MILE _____ SEC. 27, T. 14 N, R. 8 W, MDB&M
SAMPLED BY DWR-Sacramento
ANALYSIS ON PAGE A-193 TABLE 5

STATION Clear Lake at Lakeport
SAMPLING POINT end of pier at foot of 3rd Street at North end of park.
Staff gage located on piling at end of pier.

STATION NO. 41 REGION NO. 5 COUNTY Lake
AT RIVER MILE _____ SEC. 24, T. 14 N, R. 10 W, MDB&M
SAMPLED BY DWR-Sacramento
ANALYSIS ON PAGE A-195 TABLE 5

TABLE 5

SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Colusa Trough near Colusa

SAMPLING POINT Colusa-Williams highway bridge, 3 miles west of Colusa.

Water stage recorder on upstream side of bridge.

STATION NO. 87 REGION NO. 5 COUNTY Colusa

AT RIVER MILE _____ SEC. 34, T 16 N, R 2 W, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-197 TABLE 5

STATION Cosumnes River near Michigan Bar

SAMPLING POINT Michigan Bar road bridge about 1 mile north of Michigan

Bar.

STATION NO. 94 REGION NO. 5 COUNTY Sacramento

AT RIVER MILE _____ SEC. 36, T 8 N, R 8 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-199 TABLE 5

TABLE 5
SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Cottonwood Creek near Cottonwood
SAMPLING POINT Right bank at gage house located 2 miles east of
Cottonwood.

STATION NO. 12b REGION NO. 5 COUNTY Shasta
AT RIVER MILE 2.5 SEC. 7, T. 29 N, R. 3 W, MDB&M
SAMPLED BY DWR-Sacramento
ANALYSIS ON PAGE A-201 TABLE 5

STATION Deer Creek near Vina
SAMPLING POINT Left bank under U. S. Highway 99E bridge 1 mile
north of Vina. DWR gage located approximately 400'
downstream from 99E bridge on left bank.

STATION NO. 95 REGION NO. 5 COUNTY Tehama
AT RIVER MILE _____ SEC. 14, T. 24 N, R. 2 W, MDB&M
SAMPLED BY DWR-Sacramento
ANALYSIS ON PAGE A-203 TABLE 5

TABLE 5

SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Delta-Cross Channel near Walnut Grove

SAMPLING POINT left bank 0.2 mile downstream from gates when gates are
open and from highway bridge when gates are closed.

STATION NO. 98 REGION NO. 5 COUNTY Sacramento

AT RIVER MILE _____ SEC. 35, T 5 N, R 4 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-205 TABLE 5

STATION Delta-Mendota Canal near Mendota

SAMPLING POINT right bank one mile upstream from canal gates and
2 miles north of Mendota on Bass Road.

STATION NO. 92 REGION NO. 5 COUNTY Fresno

AT RIVER MILE _____ SEC. 19, T 13 S, R 15 E, MDB&M

SAMPLED BY DWR-Sacramento

ANALYSIS ON PAGE A-207 TABLE 5

TABLE 5
SAMPLING STATION DATA
CENTRAL VALLEY REGION

STATION Delta-Mendota Canal near Tracy
SAMPLING POINT Left bank downstream from Byron-Bethany road cross-
over, about 1 mile from Tracy Pumping Plant, about 10 miles
northwest of Tracy.

STATION Alamo River near Calipatria
 SAMPLING POINT left bank 6.2 miles north of Westmorland--Calipatria
Highway, 0.4 mile downstream from lateral 3-road bridge
at Imperial Irrigation District Station AR-17.

STATION NO. 60 REGION NO. 7 COUNTY Imperial
 AT RIVER MILE 2.5 SEC. 15, T 11 S, R 13 E, SBB&M
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-343 TABLE 7

TABLE 7

SAMPLING STATION DATA
COLORADO RIVER BASIN REGION

STATION All American Canal near Pilot Knob

SAMPLING POINT left bank just upstream from Highway 80 bridge, over
canal, 5 miles west of Yuma Bridge. Imperial Irrigation
District Station 1035 (lower slope).

STATION NO. 56a REGION NO. 7 COUNTY Imperial

AT RIVER MILE 20 SEC. 24, T 16 S, R 21 E, SBB&M

SAMPLED BY DWR-Los Angeles; Sampled May and September.

ANALYSIS ON PAGE A-345 TABLE 7

STATION Colorado River near Topock, Arizona

SAMPLING POINT USGS auxiliary gage on furthest downstream high
pressure gas line bridge from Highway 66 bridge. Right
bank, California side.

STATION NO. 54 REGION NO. 7 COUNTY San Bernardino

AT RIVER MILE 196* SEC. 8, T 7 N, R 24 E, SBB&M

SAMPLED BY DWR-Los Angeles; Sampled May and September

ANALYSIS ON PAGE A-346 TABLE 7

* From California-Arizona-Mexico Boundary junction.

TABLE 7

SAMPLING STATION DATA
 COLORADO RIVER BASIN REGION

STATION Colorado River below Morelos Dam
 SAMPLING POINT from left bank 1/4 mile downstream from Morelos Dam,
Arizona side. The dam is approximately one mile
downstream from California-Arizona-Mexico boundary
junction.

STATION NO. 56b REGION NO. 7 COUNTY Yuma
 AT RIVER MILE -1* SEC. 28, T 8 S, R 24 W, G&SRM
 SAMPLED BY DWR-Los Angeles; Sampled May and September
 ANALYSIS ON PAGE A-347 TABLE 7

* From California-Arizona-Mexico Boundary junction.

STATION Colorado River near Blythe
 SAMPLING POINT at boat dock approximately one-half mile downstream
from US 60-70 Highway bridge. Sampled from California
side.

STATION NO. 56c REGION NO. 7 COUNTY Imperial
 AT RIVER MILE 98* SEC. 2, T 7 S, R 23 E, SBB&M
 SAMPLED BY DWR-Los Angeles; Sampled May and September
 ANALYSIS ON PAGE A-348 TABLE 7

* From California-Arizona-Mexico Boundary junction.

TABLE 7

SAMPLING STATION DATA
COLORADO RIVER BASIN REGION

STATION Colorado River at Parker Dam
 SAMPLING POINT shore at right bank on California side 1 mile upstream
from USGS gage. 3 miles downstream from Parker Dam;
11 miles northeast of Parker, Arizona. Sampled from
River Lodge boat dock.

STATION NO. 55 REGION NO. 7 COUNTY San Bernardino
 AT RIVER MILE 149.7* SEC. 16, T 2 N, R 27 E, SBB&M
 SAMPLED BY DWR-Los Angeles; Sampled May and September
 ANALYSIS ON PAGE A-349 TABLE 7

* From California-Arizona-Mexico Boundary junction.

STATION Colorado River at Yuma, Arizona
 SAMPLING POINT left bank at old Highway 80 bridge. USGS gage is 0.4
mile downstream from sample point.

STATION NO. 56 REGION NO. 7 COUNTY Yuma
 AT RIVER MILE 7.5* SEC. 36, T 16 S, R 22 E, G&SRM
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-350 TABLE 7

* From California-Arizona-Mexico Boundary junction.

TABLE 7

SAMPLING STATION DATA
 COLORADO RIVER BASIN REGION

STATION Lake Havasu at Metropolitan Water District intake

SAMPLING POINT right bank at the MWD Intake, 1½ mile upstream from
 Parker Dam.

STATION NO. 56d REGION NO. 7 COUNTY San Bernardino

AT RIVER MILE 156* SEC. 28, T 3 N, R 27 E, SBB&M

SAMPLED BY MWD

ANALYSIS ON PAGE A-351 TABLE 7

* From California-Arizona-Mexico Boundary junction.

STATION New River International Boundary

SAMPLING POINT right bank at road bridge, 150 yards north of
 International boundary. Imperial Irrigation District
 Station NR-1.

STATION NO. 57 REGION NO. 7 COUNTY Imperial

AT RIVER MILE 56 SEC. 14, T 17 S, R 14 E, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-353 TABLE 7

TABLE 7

SAMPLING STATION DATA
 COLORADO RIVER BASIN REGION

STATION New River near Westmorland

SAMPLING POINT right bank 50 feet north of Vail Canal, 3 miles west of
Calipatria-Westmorland Highway, 0.6 mile downstream from
Trifolium #10 Road bridge. Imperial Irrigation District
Station NR-17.

STATION NO. 58 REGION NO. 7 COUNTY Imperial

AT RIVER MILE 5 SEC. 30 T 12 S, R 13 E, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-355 TABLE 7

STATION Whitewater River at Whitewater

SAMPLING POINT 8 feet Cipoletti weir 1.6 mile upstream from Whitewater.
2 USGS gages, one on river and one on weir.

STATION NO. 68 REGION NO. 7 COUNTY Riverside

AT RIVER MILE 54 SEC. 2 T 3 S, R 3 E, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-357 TABLE 7

TABLE 8

SAMPLING STATION DATA
SANTA ANA REGION

STATION Chino Creek near Chino

SAMPLING POINT right bank 20 feet upstream from Pine Avenue Bridge
approximately 5 miles southeast of Chino.

STATION NO. 86 REGION NO. 8 COUNTY San Bernardino

AT RIVER MILE 5 SEC. 36, T 2 S, R 8 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-359 TABLE 8

STATION Lake Elsinore north shore

SAMPLING POINT north shore of lake at USGS staff gage, approximately
0.5 mile south of junction of Riverside Drive and State
Highway 71.

STATION NO. 89 REGION NO. 8 COUNTY Riverside

AT RIVER MILE _____ SEC. 1, T 6 S, R 5 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-361 TABLE 8

TABLE 8

SAMPLING STATION DATA
SANTA ANA REGION

STATION Santa Ana River near Arlington
 SAMPLING POINT from right bank at Pedley Road bridge 75 feet upstream
from USGS gage. 3.3 miles northeast of Arlington and
1/2 mile downstream from Riverside Sewage Treatment Plant.

STATION NO. 51* REGION NO. 8 COUNTY Riverside
 AT RIVER MILE 44 SEC. 25 T. 2 S. R. 6 W. SBB&M
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-363 TABLE 8

* Discontinued September, 1955.

STATION Santa Ana River near Prado Dam
 SAMPLING POINT from left bank, at USGS gage; 2500 feet downstream from
Prado Dam; 4 mile west of Corona.

STATION NO. 51a REGION NO. 8 COUNTY Riverside
 AT RIVER MILE 31.6 SEC. 29 T. 3 S. R. 7 W. SBB&M
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-364 TABLE 8

TABLE 8

SAMPLING STATION DATA
SANTA ANA REGION

STATION Santa Ana River near Mentone

SAMPLING POINT southern California Edison Company's Santa Ana River
No. 3 Power Plant tailrace. 3.5 miles northeast of
Mentone near mouth of Canyon.

STATION NO. 51b REGION NO. 8 COUNTY San Bernardino

AT RIVER MILE 72.7 SEC. 4, T 1 S, R 2 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-366 TABLE 8

STATION Santa Ana River at Riverside (MWD Blowoff)

SAMPLING POINT from left bank, 200 yards upstream from Metropolitan
Water District Aqueduct Crossing, and 0.5 miles upstream
from Riverside Sewage Treatment Plant.

STATION NO. 51d REGION NO. 8 COUNTY Riverside

AT RIVER MILE 45.5 SEC. 30, T 2 S, R 5 W, SBB&M

SAMPLED BY DWR-Los Angeles

ANALYSIS ON PAGE A-368 TABLE 8

TABLE 8

SAMPLING STATION DATA
SANTA ANA REGION

STATION Santa Ana River at Norco
 SAMPLING POINT at USGS summer gage just downstream from Hammer Ave.
bridge on left bank.

 STATION NO. 51e REGION NO. 8 COUNTY Riverside
 AT RIVER MILE 38 SEC. 36, T 2 S, R 7 W, SBB&M
 SAMPLED BY DWR-Los Angeles
 ANALYSIS ON PAGE A-370 TABLE 8

STATION Warm Creek at Colton
 SAMPLING POINT from right bank near USGS gage at "F" Street bridge,
1/4 mile north of U. S. Highway 99 and 0.4 mile east of
Mt. Vernon Avenue, 1.2 mile east of Colton, 0.3 mile
below San Bernardino Sewage Disposal Plant.

 STATION NO. 50b REGION NO. 8 COUNTY San Bernardino
 AT RIVER MILE 0.4 SEC. 21, T 1 S, R 4 W, SBB&M
 SAMPLED BY DWR-Los Angeles to 7-11-55; 8-55 to date by City of San
Bernardino
 ANALYSIS ON PAGE A-372 TABLE 8

TABLE 8

SAMPLING STATION DATA
SANTA ANA REGION

STATION Warm Creek at San Bernardino

SAMPLING POINT from right bank beneath "E" Street bridge, 0.5 mile
upstream from San Bernardino Sewage Disposal Plant.

STATION NO. 50c REGION NO. 8 COUNTY San Bernardino

AT RIVER MILE 1.4 SEC. 15, T 1 S, R 4 W, SBB&M

SAMPLED BY DWR-Los Angeles to 7-11-55; 8-55 to date by City of San
Bernardino

ANALYSIS ON PAGE A-374 TABLE 8

o Iron (Fe), aluminum (Al), arsenic (As), copper (Cu), lead (Pb), manganese (Mn), zinc (Zn), and chromium (Cr), reported here as $\frac{0.0}{1000}$ except as shown.

b Determined by addition of analysed constituents.

c Gravimetric determination.

d Annual median and range, respectively. Calculated from analyses of duplicate monthly samples made by Calif. Dept. of Public Health, Division of Laboratories and Control, San Francisco (USGS), Pacific Chemical Consultant (PCC), Metropolitan Water District (MWD), Los Angeles Dept. of Water & Power (LADPH), City of Los Angeles Dept. of Public Health (LADPH).

e Mineral analyses made by USGS. Quality of Water Branch (USGS), Pacific Chemical Consultant (PCC), Metropolitan Water District (MWD), Los Angeles Dept. of Water & Power (LADPH), City of Los Angeles Dept. of Public Health (LADPH).

Not Rated in 1956																				

a Iron (Fe), aluminum (Al), arsenic (As), copper (Cu), lead (Pb), manganese (Mn), zinc (Zn), and chromium (Cr), reported here as $\frac{ppm}{1000}$ except as shown.

b Determined by addition of analysed constituents

c Gravimetric determination.

d Annual median and range, respectively. Calculated from analyses of duplicate monthly samples made by Calif. Dept of Public Health, Division of Laboratories.

e Mineral analyses made by USGS, Quality of Water Branch (USGS), Pacific Chemical Consultant (PCC), Metropolitan Water District (MWD), Los Angeles Dept. of Water & Power (LAOWP), City of Los Angeles Dept of Pub Health (LAOPH), Long Beach Dept of Pub Health (LBOPH) or State Division of Water Resources (DWR), as indicated.

* Not revised																					

o Iron (Fe), aluminum (Al), arsenic (As), copper (Cu), lead (Pb), manganese (Mn), zinc (Zn), and chromium (Cr), reported here as $\frac{00}{1000}$ except as shown.

b Determined by addition of analyzed constituents

c Gravimetric determination

d Annual median and range, respectively. Calculated from analyses of duplicate monthly samples made by Calif. Dept. of Public Health, Division of Laboratories.

e Mineral analyses made by USGS, Quality of Water Branch (USGS), Pacific Chemical Consultant (PCC), Metropolitan Water District (MWD), Los Angeles Dept. of Water B Power (LAOWP), City of Los Angeles Dept. of Pub Health (LAOPH), Long Beach Dept. of Pub Health (LBPH) or State Division of Water Resources (DWR), as indicated

a Iron (Fe), aluminum (Al), arsenic (As), copper (Cu), lead (Pb), manganese (Mn), zinc (Zn), and chromium (Cr), reported here as 0.00 except as shown.

b Determined by addition of analysed constituents

c Gravimetric determination.

d Annual median and range, respectively. Calculated from analyses of duplicate monthly samples made by Calif. Dept. of Public Health, Division of Laboratories.

e Mineral analyses made by USGS, Quality of Water Branch (USGS), Pacific Chemical Consultant (PCC), Metropolitan Water District (MWD), Los Angeles Dept. of Water & Power (LADWP), City of Los Angeles Dept. of Pub Health (LADPH), Long Beach Dept. of Pub Health (LBPH) or State Division of Water Resources (DWR), as indicated.

APPENDIX B

Procedures and Interpretation of Results for
Water Pollution Radioassay

APPENDIX B

PROCEDURES AND INTERPRETATION OF RESULTS FOR WATER POLLUTION RADIOASSAY (Revised September 11, 1957)

I. ANALYTICAL PROCEDURES

A. Sample Preparation

1. Samples are collected in one-half gallon jugs during the routine stream sampling program.
2. On receipt in the laboratory, each sample is well mixed, and two - 250 ml aliquots taken. Each is acidified with a few drops of glacial acetic acid, and two drops of colloidal graphite suspension (aquadag) added.
3. The aliquot is filtered under suction through a membrane ("Millipore") filter, which retains suspended particulate matter of approximately 0.2 microns diameter and larger. Filters are treated with an antistatic preparation (Merix Anti-Static #79-OL) to eliminate any extraneous electrostatic charge.
4. The filtrate is placed in a 250 ml volumetric flask, inverted and the mouth placed in a 1 3/4" x 1/4" aluminum culture dish in a "chicken-feeder" type arrangement. The flask is supported by a ring stand; the dish rests on a hot plate adjusted so that the sample is taken to dryness at a temperature well below boiling.
5. At this point there are duplicate samples of both suspended solids and dissolved material from each original water sample ready for determination of radioactive content.

B. Counting Techniques

1. Two determinations are made on each sample, one for gross beta one for gross alpha radioactivity. This represents a total of eight determinations for each original sample.
2. Beta activity is determined with an internal gas flow counter operating in the proportional region, using argon-methane mixture as a flow gas. Background determinations are made before the first sample count each day, and then after each two sample counts throughout the day. Determinations of counter efficiency are made with a reference standard (thallium - 204) at least twice daily. Each determination of sample and background count rate is made for a total of 4096 counts. Since samples are run in duplicate, the total time for each sample count and background determination is 64 minutes.

3. Alpha activity is determined with a scintillation counter utilizing an activated zinc sulfide phosphor. Sample, background and efficiency measurements are made in the same manner as are the beta measurements. Polonium -210 is used as an alpha reference standard. Each determination of sample and background count rate is made for a pre-set time of 32 minutes.

C. Calculations

1. Results are expressed as micromicrocuries per liter (uuc/l). One micromicrocurie is equivalent to 2.22 disintegrations per minute. Four values are reported for each sample: (a) beta activity in the solids retained on the filter; (b) beta activity in the filtrate (dissolved material); (c) alpha activity in the solids; and (d) alpha activity in the filtrate.
2. Sample counts are corrected for background and geometric efficiency.
3. Standard statistical procedures are utilized to compute the 0.9 error. The final result is expressed (symbolically) as $x \pm y$ uuc/l. This means that in a series of determinations on the same sample, the value of x should fall between $x - y$ and $x + y$, 90 per cent of the time.
4. In cases where zero or negative values are included between the limits of $x + y$ and $x - y$ the result is reported symbolically as $-0-$.

II. LIMITATIONS OF METHODS EMPLOYED

A. Sample Preparation

A perfect sample for determination of radioactive content would be infinitely thin, and would contain all of the constituents of the original material except the water.

In practice, those criteria are virtually impossible to attain. Essentially infinitely thin samples can be prepared only from water with low solid and dissolved salt contents. Some solid and dissolved materials are absorbed on the walls of vessels used in sample collection and preparation. Volatilization and losses from spattering during volume reduction cannot be completely avoided.

Thus, obviously, radioassay results are dependent upon sample preparation techniques.

B. Nature of the Radioactive Disintegration Process and the Measurement thereof.

At least three basic phenomena make the exact determinations of low levels of radioactivity extremely difficult. These are:

1. The random nature of the radioactive disintegration process limiting the accuracy of any determination because of statistical fluctuations inherent in the counting data.
2. The low ratio of sample count to background count. Any detector of radioactivity always measures (in the absence of an active sample) at a certain - and not always constant - level, which is termed the background radiation level. This is caused by cosmic radiation, traces of naturally occurring radioactive materials, and sometimes by "noise" characteristic of the electronic equipment used. In making determinations on samples in which the counting rate is only slightly higher than the background counting rate, inherent errors are relatively large.
3. Self-absorption. Unless samples are essentially infinitely thin, alpha and low-energy beta radiation arising from the lower layers of the samples may not penetrate the upper layers, and therefore remain undetected.

Corrections can be made for self-absorption when dealing with known radioisotopes. In cases where the contaminant is not identifiable, these corrections cannot, as a rule, be made.

C. Calculations

There are three values which can lead to errors in the reported results. These are:

1. Geometric efficiency. This factor is determined using artificial standards. These are not prepared in the same manner as samples. Also it is possible that the energy of radiations emanating from the two standards may be significantly different from the unknown. Both of these considerations make the factors used rather artificial, and somewhat in error. It is not possible to determine the magnitude of this error, although it is probably not large in most cases.
2. Errors in sample count. Reasons for this were discussed in sections A and B above.
3. Errors in confidence limits. Statistical computations made are based on the Gaussian approximation of the Poisson distribution law. At low count rates this approximation is subject to error.

The calculated confidence limits are based solely on statistical fluctuations caused by the random nature of the radioactive disintegration process. It is assumed that counts produced by background radiation and by electronic noise are also random.

All of the foregoing would tend to indicate that absolute determination of low levels of radioactivity is impossible. This is true, but by taking every possible measure to reduce sources of error, it is possible to obtain a relatively accurate measure of these low levels. As activity levels increase from near background, the precision of measurement increases correspondingly.

III. LIMITS OF DETECTABILITY

A. Minimum Detectable Levels

1. Beta Activity: Equipment and techniques used are such that the minimum reliably detectable beta activity amounts to 7-8 uuc/l.
2. Alpha Activity: Due principally to lower levels of alpha background radiation, alpha activity of the order of 1 uuc/l can be reliably detected.

There is one situation in which it is not possible to report such small amounts of activity. Some stream samples contain particulates of an amount and size distribution that causes the filter to clog. In such cases, it is not possible to filter a full 250 ml sample. Consequently, in applying the volume factor (see Sample Calculations) to subsequent calculations, a large error is introduced.

B. Minimum Detectable Changes in Levels of Radioactivity

Knowing minimum detectable quantities of radioactivity, it is then pertinent to inquire as to the minimum increases above these which can be reliably measured. It is not possible to assign fixed values here, but it amounts to about 2 uuc/l for beta, and 0.3 uuc/l for alpha contamination.

IV. INTERPRETATION OF RESULTS

The various factors which limit the accuracy of measurement should be kept in mind in making interpretations of results. These factors are of considerable consequence for determinations which are only slightly above the background level, which is generally the case here.

The maximum concentration of radioactive contaminants of unknown nature in drinking water has been set at 100 uuc/l. In this study, levels this high are generally not expected. The purpose is to establish a baseline or background level, and to provide a continuing check to determine if and when increases occur as a result of rapidly expanding peacetime uses of radioactive materials.

V. SAMPLE CALCULATIONS

R_s = Average count rate of duplicate samples = 55 counts/minute

R_b = Average count rate of background determinations = 50 counts/minute

Net count = $R_s - R_b = 55 - 50 = 5$ counts/minute

t = time of sample count = count = time of background count = 64 minutes

Activity = $\frac{5 \text{ c/m} \times 4 \text{ (volume factor to put on a liter basis)}}{0.5 \text{ (geometric efficiency factor)} \times 2.22 \text{ d/m/uuc}} = 18.0 \text{ uuc/l}$

$$0.9 \text{ confidence level} = 1.645 \sqrt{\frac{R_s}{t} + \frac{R_b}{t}}$$

$$= 1.645 \sqrt{\frac{55}{64} + \frac{50}{64}}$$

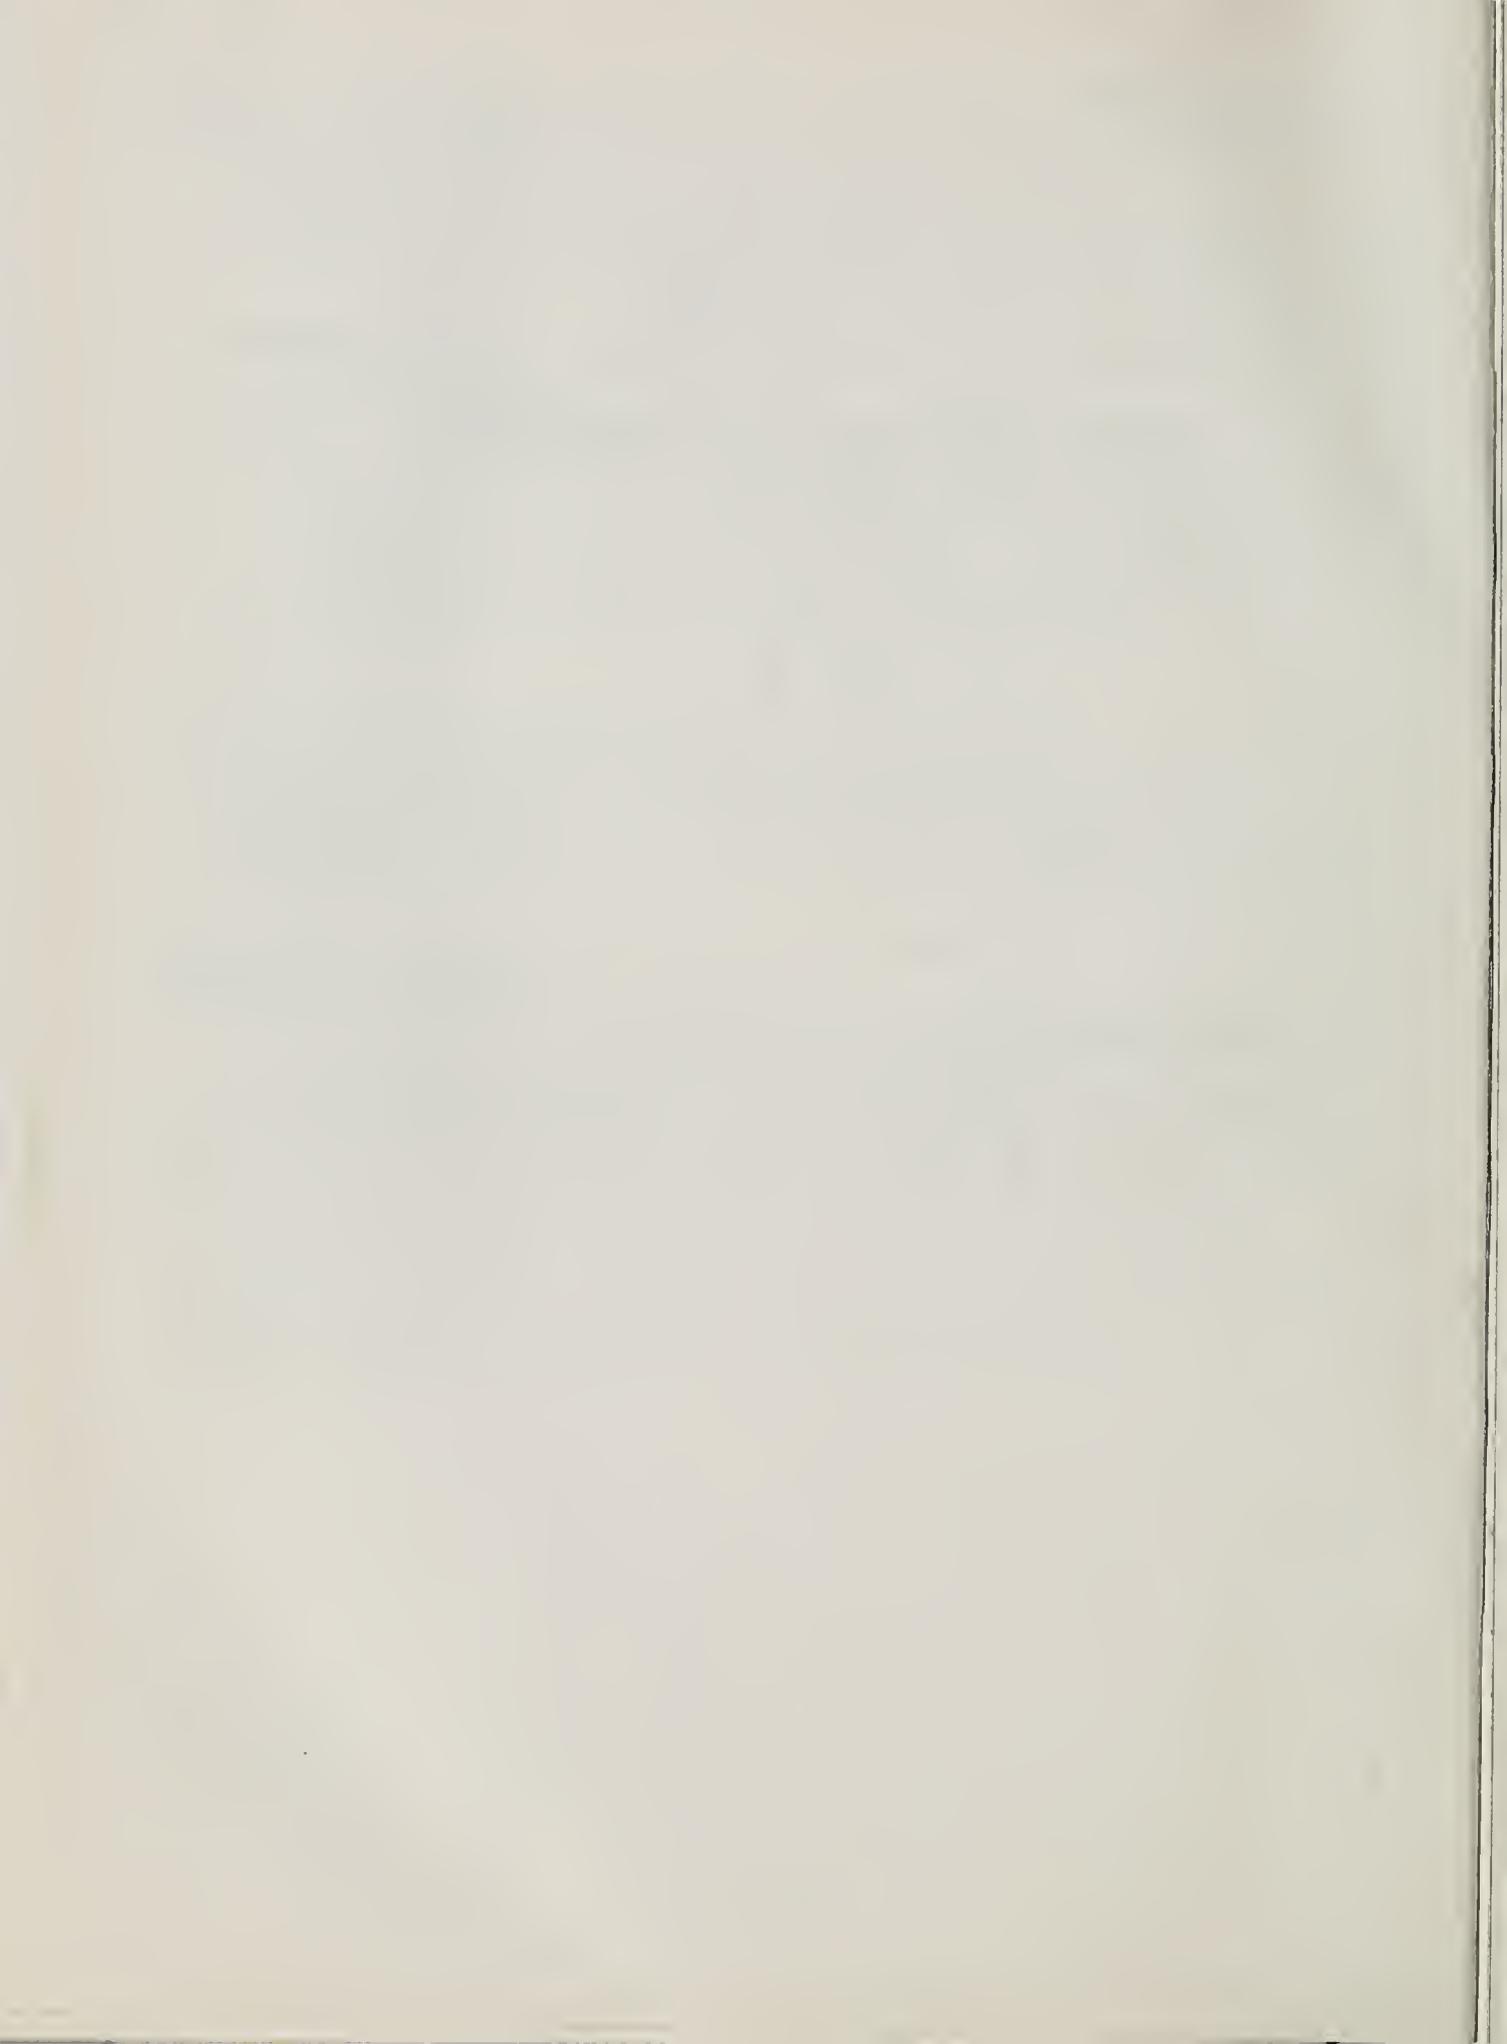

$$= 2.1 \text{ counts/minute}$$

$$\frac{2.1 \times 4}{.5 \times 2.22} = 7.6 \text{ uuc/l}$$

Thus the activity of this sample is 18.0 ± 7.6 uuc/l

This means that in a series of determinations on this sample, 90 per cent of the time the value would fall between 10.4 and 25.6 uuc/l.

This basic formula is used for alpha and beta determinations. For alpha, t_s and t_b are constant. For beta, t_s and t_b are constant. For beta, t_s and t_b are variable and are functions of R_s and R_b respectively.
