

Proposal Monitoring

Water Savings Monitoring

Sensus Logic Meter Data Management (“MDM”) software will be integrated with the City’s existing InCode billing system. Billing exports will be performed through the MDM logic predefined file transfer to the billing software when its needed eliminating the need to drive to obtain the meter reads.

MDM Logic’s built-in validation capability is one of the core features and benefits of the solution. During the data processing phase, Logic will compare data against predefined parameters to assure the data is precise. Validation is completed through a series of logically related tasks that assures the data is accurate, complete, and relevant.

MDM Logic includes the ability to schedule critical reports based on needs. Automated notifications assure that the right information is presented to the right personnel at the right time. These notifications will be used for event types such as leaks, reverse flow, tampers, and system health status reports. Notifications are delivered via email to City staff. This allows staff to proactively address various conditions without having to wait to review reports that are currently generated on a monthly schedule.

Energy Savings Monitoring

Fuel reduction will be monitored by the City’s Syntech FUELMASTER system. Based on odometer readings, the system calculates vehicle efficiency and fuel consumption. Reports will be run monthly on vehicles to show reduction in fuel consumption, savings, and GHG reduction.
