Project Monitoring

Project Monitoring

Monitoring will entail an inventory of installed and retrofitted devices completed through the project and an analysis of water consumption data for a segment of the participating sites.

Standardized water savings assumptions for water efficient devices, developed by the Metropolitan Water District of Southern California (MWD), will be utilized to calculate the water, energy, and greenhouse gas savings of the overall project.

After the completion of the project, pre- and post-retrofit water consumption data will be obtained from a segment of the project sites and analyzed for volumetric changes. Post-retrofit data will be collected for up to one year after completion of the project. Volumetric changes in water consumption data will be utilized to calculate the water, energy, and greenhouse gas savings of the overall project utilizing the same formulas that are provided in the GHG Savings table (Attachment 2).
